66. Simplicius in *Phys.*, 611 ff., discussed by Sambursky, *The Physical World of Late Antiquity*, pp. 8-9. For space's indivisibility, cf. 612.7 ff.; on its impassibility, *ibid.*, 20-1; cf. also 613.15-20. Sambursky (*op. cit.*, p. 9) compares the modern physicists' conception of "ether"; similarly, Conze (*op. cit.*, p. 165, n.) compares the Buddhist conception of space with the Cabbalistically influenced view of Henry Moore; he further notes the influence on Einstein of the Cabbala's ideas on light and space.
67. Obermiller, p. 188; cf. pp. 186-91.
68. Cf. the passage of Nemesius cited above (n. 62); also, *Enn.*, I.1.3.10 ff. and IV.3.22.1-9, discussed below. Dörrie notes (*op. cit.*, p. 75) that the union of light and air had been used by Chrysippus in support of the Stoic view (*SVF* II.473, p. 155, line 38; cf. Alexander, *de Mixt.*, 218.6). The same text (*ibid.*, p. 155, lines 30-2) also uses the analogy of the penetration of iron by fire; it is interesting that this analogy is used by Ruysbroeck to illustrate the soul's union with God (cf. Stace, *Mysticism and Philosophy*, pp. 222-3), and by Śaṅkara (*Viveka-Chudāmani*, 530) to illustrate how the union of Buddhi (intellect) with consciousness gives rise to the senses. We thus have (a) one more remarkable parallel between Greek and Indian thought and (b) an example of how both "monistic" and "theistic" mysticism can use the same analogy in support of their respective positions!
69. Cf. above, p. 103 f.
70. Cf. above, p. 108, for the Epicurean and Sceptical influence on Plotinus's view of divine activity; p. 109, for the influence of the Stoic account of divine omniscience; and p. 111, for the influence of *Parmenides*, 131.B.
71. Zaehner's dating of the *Gītā* (introduction, p. 7) between the fifth and second centuries B.C. probably represents the general view.
72. Nemesius, 129.9 (Dörrie, *op. cit.*, p. 54) ascribes the Neoplatonic view of the soul-body union to Plotinus's teacher Ammonius Saccas. While the hypothesis that Ammonius was himself an Indian missionary (Seeberg, *Ztschrif. Kirchengeschichte* 61 (1942), pp.

136-70; E. Benz, *Abb. Mainz* (1951 no. 3), pp. 197 ff.) deserves no credence, the analogy in question might suggest *some* Indian influence on his thought.

## Meditative States in the Abhidharma and in Pseudo-Dionysius

David F. T. Rodier

*American University  
Washington, D.C.*

The thesis of this paper is that some problems in the Buddhist philosophy's Abhidharma tradition can be illuminated, if not solved, by a comparison with the account of meditative states in the Neoplatonic mysticism of Pseudo-Dionysius. There are three specific problems which I shall consider in this paper. These are: (1) the reason for the inclusion of the four formless meditative states (*arūpadhyānāni*) in the Abhidharma typology of meditative states; (2) the relation of the formless meditative states to the form meditative states (*rūpadhyānāni*); and (3) the structure of the formless meditative states and their internal relations.

In this paper I shall pursue my thesis as a systematic rather than historical problem. In so doing I shall attempt totally to avoid the vexingly complex and extremely murky question of the existence or extent of contact between the Buddhist schools of India and the Neoplatonic academies of the Roman world. Furthermore, since my concern is systematic rather than historical I shall utilize quite indifferently both ancient and modern expositions of the Abhidharma tradition, requiring only that my authors be attempting to present traditional

Buddhist categories, rather than claiming to reinterpret those categories in contemporary Western terms. For simplicity of exposition I shall be quoting mainly from the Pali Abhidharma literature with only occasional reference to the Sautrāntika formulation of the Abhidharma as it is preserved in the Sanskrit and Tibetan commentarial tradition based on the *Abhidharma kośa* and I shall ignore the Sarvastivada materials preserved in the Chinese Tripitaka. As a further aid to simplicity of exposition I shall only use the *Mystical Theology* as my source for Pseudo-Dionysius's typology of meditative states and I shall not consider how a detailed reading of the entire Dionysian corpus might affect the interpretation of the typology of the *Mystical Theology*. It must be understood that I am not unmindful of the differences between the various Abhidharma traditions nor uninterested in the more general problems of interpreting the *Mystical Theology* in the wider context of Neoplatonism. However, this paper is essentially exploratory. It is only concerned to suggest that certain comparisons might be illuminating. If it does succeed in creating an initial plausibility for the claim that such a comparison of the accounts of meditation in Neoplatonism and in Buddhism could be fruitful, then, perhaps, the more detailed exploration of each tradition required to develop the comparison might seem to someone to be worth the effort.

For the purposes of exposition I shall first discuss the basic categories of the Abhidharma which are necessary to understand its account of the formless meditative states. Then I shall be able to state more specifically the three questions which this account raises. I shall then discuss several traditional interpretations of the typology and show how they fail to answer the questions raised. I shall then discuss two non-traditional modern suggestions for reinterpreting the traditional accounts and show how they do not quite answer the questions I raise. Next, I shall briefly sketch the account of meditation given in the *Mystical Theology*. Finally, I shall suggest a possible comparison between that account and the

formless meditative states and show how such a comparison might illuminate the three questions I raised initially.

### I. Meditative States in the Abhidharma Tradition

According to the Abhidharma tradition of Buddhist philosophy there are only four ultimate entities: *citta* (mind); *cetasika* (mental concomitants); *rūpa* (matter) and *Nirvāna*.<sup>1</sup> Of these four, mind is by far the most important for it is by control of the mind that *Nirvāna* is realized; it is the mind which is the foundation for the mental concomitants (*cetasikas*); and it is mind, not matter, which determines the structure of Buddhist cosmology.

Buddhist cosmology views the world as divided into three realms: (1) the realm of desire (*kāmaloka*); (2) the realm of form (*rūpaloka*); and (3) the formless realm (*arūpaloka*). This three-fold classification is based on the Abhidharma's triple classification of mind into ordinary consciousness and the two forms of meditative consciousness (*jhānas*), i.e., the form meditative state (*rūpajhāna*) and the formless meditative state. Of these three, ordinary consciousness and its field of operation, the desire realm, occupies much of the discussion in the Abhidharma tradition; for the understanding of ordinary consciousness in moral or immoral, resultant or causally neutral states together with the number and strength of the mental concomitants found in each of these states not only is crucial for understanding the phenomena which occur in the initial stages of meditation practice but such an understanding also provides a framework within which the mental events of daily life can be understood and thus regulated. Likewise, the desire realm which is the field in which ordinary consciousness operates with its heavens and hells, its humans, animals, gods, demons and hungry ghosts, is common to iconography and popular story.<sup>2</sup> However, despite their significance, it is not the ordinary states of consciousness but the meditative states which are our concern here. The meditative realms and the meditative states of consciousness are strictly correlated,

for it is by cultivating a given meditative state that awareness of the corresponding meditative realm is obtained.

The first group of meditative states, the form meditative states (*rūpajhānāni*) has a structure which is both logical and easily grasped. The first form meditative state has five factors. These are: (1) *vitakka* [*vitarka*]; (2) *vicāra*; (3) *pīti* [*prīti*]; (4) *sukha*; (5) *ekaggatā* [*ekāgratā*].<sup>3</sup> These five factors may be translated roughly as follows: *vitakka* by "initial application to the object of meditation"; *vicāra* by "sustained application to the object of meditation"; *pīti* by "joy"; *sukha* by "happiness," and *ekaggatā* by "single-pointedness."<sup>4</sup> A more detailed explanation of these terms according to one commentarial tradition is as follows. Here *vitakka* is being used not in its usual literal meaning of "thinking" or "reasoning" but in its special sense as a mental concomitant found in many mental states, whose function is to direct the concomitant states towards the object. ("Ārammaṇaṃ vitakketi sampayutt adhamma abhinero petīti vitakko." "Just as a King's favorite would conduct a villager to the palace, even so *vitakka* directs the mind towards the object.")<sup>5</sup> Like *vitakka*, the second factor, *vicāra*, is not here used in its usual sense, that of investigation. It means instead the sustained application of the mind to the object. "According to the commentary, *vicāra* is that which moves around the object. Examination of the object is its characteristic. *Vitakka* is like the buzzing of a bee towards a flower. *Vicāra* is like its buzzing around it. As *jhāna* factors they are correlates."<sup>6</sup> *Pīti* is the factor whose presence inhibits the arising of *vyāpāda* (ill-will or aversion) in this meditative state; while the presence of *sukha* inhibits the arising of both restlessness (*uddhacca*) and brooding (*kukkucca*). "*Pīti* creates interest in an object, while *sukha* enables one to enjoy the object. Like the sight of an oasis to a weary traveller is *pīti*. Like drinking water and bathing therein is *sukha*."<sup>7</sup> The final factor, single-pointedness (*ekaggatā*) prevents the arising of sensual desires in these meditative states.

All five factors are present in the first or lower of the form meditative states and by progressively eliminating factors the meditator rises to the higher form meditative states. These higher states are usually listed as four.<sup>8</sup> The second state has eliminated the first two factors (initial and sustained application) and is characterized only by joy, happiness and single-pointedness. The third state has eliminated not only initial and sustained application, but also the third factor, i.e., joy, and is characterized only by happiness and single-pointedness. The fourth and highest of the form meditative states eliminates all of the five factors except the last and so is characterized only by equanimity—*upekkha* [*upekṣa*], the neutral state left when joy and happiness are transcended—and single-pointedness.

Essentially, then, the account of the form meditative states is the description of various stages of meditation distinguished by the increasing simplicity of the act of concentration. In contrast to this easily grasped, logical structure the account of the formless meditative states provides no simple reason for their structure. These states are distinguished by the object of the meditative consciousness rather than by the nature of the consciousness involved. Thus the Abhidharma tradition lists as the ascendingly higher formless meditative states: (1) awareness of infinity of space (*ākāśanancāyatana*); (2) awareness of infinity of consciousness (*viññānancāyatana*); (3) awareness of nothingness (*ākincannāyatana*), and, (4) awareness of neither perception nor non-perception (*nevasaññānasaññāyatana*).

This fourfold classification of the Abhidharma tradition is found even in that strata of the Pāli canon which Western scholarship holds to be the oldest, i.e., the *Nikāyas*. Although in fairness it must be noted that while the form meditative realms are usually explicitly termed *jhānas* (*dhyānas*), the formless realms, although frequently mentioned (and uniformly given in their Abhidharma order) are rarely explicitly termed *jhānas* (*dhyānas*) in the *Nikāyas*. The following description of the four formless meditative states from the *Aṅguttaranikāya* is representative:

And how has a monk won access to the Imperturbable (*anejja*)? Therein a monk, passing utterly beyond all consciousness of objects, by ending the consciousness of reaction, by disregarding consciousness of diversity, thinking, "Infinite is space," attains and abides in the sphere of infinite space. Passing utterly beyond the sphere of infinite space, reading the sphere of infinite consciousness, thinking, "Infinite is consciousness," he abides in the sphere of infinite consciousness. Passing utterly beyond the sphere of infinite consciousness, thinking, "There is nothing at all," he attains and abides in the sphere of nothingness. Passing utterly beyond the sphere of nothingness, he attains and abides in the sphere of neither consciousness nor unconsciousness. Thus has a monk won access to the Imperturbable.<sup>9</sup>

In the *Vibhanga* (one of the seven books comprising the Pāli Abhidharma canon) the formless meditative states are described as follows:

With the complete surmounting of perceptions of matter, with the disappearance of perceptions of resistance, with non-attention to perceptions of variety, [aware of] "unbounded space," he enters upon and dwells in the [meditation] base consisting of boundless space.

By completely surmounting the [meditation] base consisting of boundless space, [aware of] "unbounded consciousness" he enters upon and dwells in the base consisting of boundless consciousness.

By completely surmounting the [meditation] base consisting of boundless consciousness, [aware that] "There is nothing," he enters upon and dwells in the [meditation] base consisting of nothingness.

By completely surmounting the [meditation] base consisting of nothingness he enters upon and dwells in the base consisting of neither perception nor non-perception.<sup>10</sup>

Given these descriptions of the four formless meditative states, we are now in a position to see the problems raised by their inclusion in the Abhidharma account of the varieties of consciousness. To begin with, the radical difference between their structuring in terms of object and the form meditative states structuring in terms of the factors present in the state gives rise to the questions of why the former are considered separate. This question seems especially acute since the Abhidharma tradition is quite clear that as far as the factors are concerned there is no difference between the fourth form meditative state and the four formless meditative states. This identity of factors leads naturally to the question of what is the precise relation between the formless meditative states and the form meditative states—especially the fourth one of the latter group. Finally, there is the question of what is the relationship which obtains between the four formless meditative states. Even if we grant that they do occur in this order—why do they so occur?

There are several possible ways of answering at least this third question given in the traditional literature. One way that the objects of the four formless meditative states could be related is given in Buddhaghosa's *Visuddhimagga*:

Of these [four formless states], the first is due to surmounting signs of materiality, the second is due to surmounting space, the third is due to surmounting the consciousness that occurred with that space as its object. So they should be understood as four in number with the surmounting of the object in each case.<sup>11</sup>

In this account it would appear that the reason for the series is that each lower stage provides the basis for the next

higher stage. Thus the elimination of the object which is the focus of the highest form meditative state gives the infinity of space which is the base of the first formless state. The elimination of the space leaving only the consciousness gives the second formless state. The elimination of consciousness gives the third and the elimination of the disappeared consciousness gives the highest formless state. However, a different explanation of the relationship between these states is also found in the traditional literature. Thus, in the ninth chapter of Anuruddhācariya's *Abhidhammatthasangaho* their relationship is described as follows:

Now, to one who practises concentration on space abstracted from any *kasina* excluding the *ākāsa kasina*, thinking, "This is infinite," there arises the first *arūpa jhāna*. To one who practises concentration on that very first *arūpajhāna*, thinking that, "It is infinite," there arises the second *arūpajhāna*. To one who practises concentration on the non-existence of the first *arūpa*-consciousness, thinking, "There is naught whatever," there arises the third *arūpajhāna*. To him who practises concentration on the third *arūpa*-consciousness, thinking, "It is calm, it is sublime," there arises the fourth *arūpa jhāna*.<sup>12</sup>

In this account, both the second and third formless meditative states are based on the first, while the fourth is based on the third. This ordering of the formless meditative states is developed in more detail by Anuruddhācariya's modern sub-commentator, The Venerable Narada Thera, in the following passage:

The Yogi who has developed the *Rūpa Jhānas* and who wishes to develop the *Arūpa Jhānas* now concentrates on the *Patibhāga Nimitta* [conceptualized image]. . . . As he does so, a faint light, like a fire fly, issues from the *Kasina* object. He wills it to expand until it covers the whole space. Now he

sees nothing but this light pervading everywhere. This developed space is not a reality but a mere concept. . . . On this concept he concentrates, thinking, "Infinite is space," until he develops the first *Arūpa Jhāna*—*ākāsānancāyatana*. . . . Again he concentrates on the first *Arūpa Jhāna*—*Viññānancāyatana*. To develop the third *Arūpa Jhāna*—*ākāṇcaññayatana* the Yogi takes for his object the first *Arūpa Jhāna* consciousness and thinks, "Natthi Kiñci," "There is nothing whatever." The fourth *Arūpa Jhāna* consciousness is developed by the taking of the third *Arūpa Jhāna* consciousness as the object. The third *Arūpa Jhāna* is so subtle and refined that one cannot definitely say whether there is a consciousness or not. As he concentrates thus on the third consciousness he develops the fourth *Jhāna*.<sup>13</sup>

Venerable Narada goes on to summarize the differences between the form *dhyānas* and formless *dhyānas* as follows:

The five *Rūpa Jhānas* differ according to the *Jhāna* factors. Those four *Arūpa Jhānas*, on the other hand, differ according to the objects of concentration. The first and third have two concepts (*Paññatī*). They are the concept of the infinity of space and the concept of nothingness. The second and the fourth *Jhāna* consciousness[es] have for their objects the first and the third consciousness[es] respectively.<sup>14</sup>

In sharp contrast with this analysis of the relationships among the four formless meditative states is the Venerable Paravahera Vajirānana's reiteration of Buddhaghosa's scheme:

. . . emerging from the fourth [form] *jhāna*, considering its tranquility as gross, being based on form object, . . . [the meditator] removes it entirely from his mind, thinking the calmness of the formless state is higher.

Recognizing this weakness [viz., the possibility that form perception may supervene], the Jhāyī [meditator] thereafter proceeds to the second stage. The thought arises within him that consciousness which can embrace infinite space, must itself be infinite. This thought brings him to the second stage, that of infinite consciousness. Continued repetition of the thought leads him into the sphere of infinite consciousness, in which he experiences a calm more profound than that of the previous stage.

But this stage of infinite consciousness is overshadowed in its turn by that of infinite space; and again realizing that this is a possible source of weakness, since his mind may revert to the sphere of infinite space, the Jhāyī determines to proceed to the greater calm of the stage of nothingness. He then establishes the thought, "There is nothing," and continues this thought until his mind rests upon nothingness—the annulment of his previous thought concerning the infinity of consciousness. . . .

But there still remains the possibility that the thought of the infinity of consciousness may intrude and the mind may slip back to the sphere of infinite consciousness. The Jhāyī, therefore, realizing that he has not yet reached the highest, proceeds to the fourth and last stage at which he enters the sphere of neither perception nor non-perception. This is achieved by the removal of the third stage; and there now remains an inexpressibly subtle trace of perception. . . . since this lingering trace of perception concerning the third stage produces no result, there is said to be no active perception within him. This is the condition known as that of "neither perception nor non-perception."<sup>15</sup>

We may sum up our discussion thus far by saying that not only do the traditional accounts provide no solid reason for

the inclusion of the formless meditative states in the Buddhist meditative scheme but they even disagree radically as to their structure. Since this is the case let us turn to two modern, Western accounts to see whether they provide any illumination.

In his "Buddha on Meditation and States of Consciousness,"<sup>16</sup> Daniel Goleman attempts to develop a "framework of landmarks" for "methodical laboratory tests of meditation and meditative states of consciousness"<sup>17</sup> on the basis of the *Visuddhimagga*. As might be expected his explicit following of Buddhaghosa's *cariya* leads him to hold that "with the formless *jhānas* the complete removal of one state constitutes the next attainment."<sup>18</sup> However, since Goleman prefers to see the formless meditative states as merely a continuation of the form states (a classification not unknown in the Abhidharma tradition), and even goes so far as consistently referring to the four formless states as the fifth, sixth, seventh, and eighth *jhānas*, he sees the four formless states as merely increasingly subtle states of concentration: "All the formless *jhānas* share the factors of one-pointedness and equanimity, but at each level these factors are progressively refined."<sup>19</sup> This interpretation has the disadvantage of not only merely repeating the traditional reasons for the inclusion of the formless meditative states—they're the same but more subtle—but it totally disregards the discontinuity between the formless and form states which is stressed as much as their similarity in the traditional accounts. Further, Goleman completely avoids our basic question concerning the structuring of the formless meditative states.

In his very suggestive essay, "ΝΟΥΣ as Experience,"<sup>20</sup> Richard T. Wallis directed attention to the possibility of clarifying certain aspects of Plotinus's teaching by directing our attention to parallels in non-Western traditions including the Buddhist tradition. In that essay Wallis not only provides a brilliant justification for the claim that Plotinus's account of the Intelligible World has an experiential base, he also makes a number of suggestions as to detailed parallels between the

Plotinian account and those of other traditions. One of Wallis's suggestions is particularly relevant to our discussion, for although he does not discuss the formless meditative states, he does see a striking similarity between Plotinian Nous and the form meditative states.<sup>21</sup> However, this suggestion would need to be rejected on grounds which Wallis himself notes,<sup>22</sup> namely, that despite its clarity, the form meditative state is characterized by a sensory object, *rūpa*, and this object is further characterized by its discreteness, separateness, from all other objects, which makes the Buddhist forms quite different from the forms of the Plotinian Nous, each of which contains all others. However, let us accept Wallis's basic premise and see whether or not there might not be other parallels between the Neoplatonic and Buddhist accounts of meditative experience which might be illuminating.

## II. Meditative States in Pseudo-Dionysius

Initially, it might seem that the familiar triadic structure of Neoplatonism would frustrate any attempt at a comparison between the four formless *jhānas* and the stages of mystical ascent described by Pseudo-Dionysius, since the structures of the Buddhist meditative states are tetradic and it is a commonplace that all Neoplatonic structures are militantly triadic. This initial impression only would be strengthened by a reading of the introduction to the *Mystical Theology*, for there, in urging the pursuit of mystic contemplation, the author defines such an activity to be leaving "the senses and the activities of the intellect, all things that the senses or the intellect can perceive, all things in this world of nothingness and in that world of being"<sup>23</sup> and straining towards a "union with Him whom neither being nor understanding can contain."<sup>24</sup> Here we quite clearly have three stages of consciousness which correlate with the usual Neoplatonic triad of Soul, Nous and the One; since the realm of sensation and the sensibles are the creations and activities of Soul, that of being and the intellect is clearly the noetic hypostasis, while that which

is beyond sensation and intellection, being neither the nothingness which is a physical object, nor the being which is an intelligible, is the One. This same insistence on the triad of sight, knowledge and vision or the realms of perception, understanding and the "Darkness which is beyond Light," is reiterated at the beginning of the second chapter of the *Mystical Theology*. It likewise is the basis for the division of the three kinds of theologies in chapter one, viz., that which describes "the Transcendent cause of all things by qualities drawn from the lowest order of being"; that which imagines that God is adequately known by human understanding; and the true, negative theology.

Of course not all the analyses of meditative states in the *Mystical Theology* are triadic. The account of Moses' stages of initiation seem to fall most naturally into a five-fold structure of purification, separation, vision, negation, and union—although these could, perhaps without too much difficulty, be reduced to an essentially triadic structure of purification of the senses followed by abstraction from the senses; noesis and abstraction from the noetic realm, a final "passive stillness of all the reasoning powers" followed by an "unfolding in that which is wholly intangible and invisible, a belonging wholly to Him that is beyond all things."<sup>25</sup> In a similar fashion the complicated meditation of chapters four and five in which Dionysius systematically negates all concepts and entities in the scale of reality from those of physical objects and their qualities up to unity, light and truth—this structure, although orderly, is hardly triadic. However, even if it were insisted that the triadic structure is fundamental to the typology of meditation found in the *Mystical Theology*, some correlation might be possible. Thus when we remember that the extreme clarity of the object in the form meditative states—a clarity which has misled many interpreters into considering these states to be "higher states of consciousness"—is but the clarity of seeing a sensory object without any of the distortions introduced by the preconceptions and inattentiveness which characterizes our ordinary consciousness. (In fact the Buddhist

distinction between perceptible objects as viewed by ordinary consciousness and by consciousness in the form-meditative state is very reminiscent of the Platonic distinction between *eikasia* and *aisthesis*.) If this is so, then the state of soul as it directs its attention towards Nous is that of the form meditative realms—characterized by increasing degrees of unity—, while the first formless meditative state—characterized by a disappearance of any object and the infinity of space left behind—is the darkness of Soul. The second formless meditative state, that of infinite consciousness, would correspond to Nous with the realm of nothingness being the darkness of intellect which precedes the final mystic vision.

If this analysis is correct then not only does the parallelism between meditative accounts based on radically different metaphysics suggest that each account might have a common factual basis—a suggestion so brilliantly developed by Wallis—but the structuring of the Neoplatonic account provides an answer to the inclusion of both the form and formless meditative states in the Buddhist scheme as well as suggesting that the account given by Buddhaghosa's *cariya* of the structure of the formless meditative states is preferable.

However, any significant comparison between these different accounts of meditative states can *not* remain on this level of establishing correspondences between numbered subdivisions. Attention must be given rather to the underlying principles. An initial approach to comparison might note that the cultivation of the formless *jhānas* is not distinct from the form *jhānas* in the Buddhist accounts. In fact, conventional treatments of meditation in the Theravada tradition normally follow the *Visuddhimagga* and interpose the cultivation of the *Brahmaviharas* the unlimited, purified emotional states of loving-kindness, compassion, sympathetic joy, and equanimity—between the cultivation of the form *jhānas* and the cultivation of the formless *jhānas*. In effect, then, the general structure is that of disciplining the mind to refrain

from wandering among many objects of attention, of purifying the emotions of a mind so restrained, and finally, withdrawing the mind from any sense-contact whatsoever and allowing it to rest in its own pure nature—a process remarkably similar to the usual development in Western mysticism of purgation, illumination, and union. Nevertheless, a basic difference between the meditation techniques of the Abhidharma tradition and those of Neoplatonism would seem to frustrate any attempt at meaningful comparison. This is the fact that the fundamental technique of Neoplatonism is “simplification”—the emptying the mind of all content—a process of detaching consciousness from any object. The basic technique of Buddhist meditation, in the Abhidharma tradition at least, is “restraint”—focusing the mind on a single object. But this contrast in meditative techniques arises only if these techniques are viewed in isolation from the total context of mental discipline. The process of simplification presented in the *Mystical Theology* explicitly presupposes the mental discipline of the *Divine Names* and the general higher degree of control of mind which the analogical arguments of Symbolic Theology require. In the same way the fixing of the mind on the meditation object, which is characteristic of the form meditative states, is in the end supplemented by the series of negations which characterize the formless states. Thus the ultimate significance of presence of the formless states in the Buddhist meditative scheme may well be that it shows that the Buddhist tradition regards the focusing of the mind as, in essence, preparatory to the detaching of the mind from the sensory world. In any event, the exploration of this kind of comparison lies outside the scope of this paper. It is enough if I have rendered plausible the claim that such further exploration might be a not quite fruitless enterprise.

## Matter and Exemplar: Difference-in-Identity in Vijñānabhikṣu and Bonaventure

John Borelli

*College of Mount Saint Vincent  
Riverdale, New York*

The major Indian conception of material causality can be both a reason for confusion and a source of insight. Translators and interpreters of Indian religious thought have identified with some consistency the term *upādāna kāraṇa* as the "material cause," which represents a significant factor in the Sāṅkhya, Yoga, and Vedānta thought schemes. Indeed, the material cause denotes the substrate out of which a thing is made; however, in these three Indian schools the term "material cause" connotes two important ideas which are lacking in the precisely defined meaning of material causality in European thought traditions. These are, namely, that an effect is simply a transformation of its cause and hence that the material cause is not separate from the efficient cause. These connotations are brought together in the Sāṅkhya-Yoga term *sat-kārya*. Often this term is interpreted as the preexistence of an effect in its cause, which ultimately implies the emanation of everything of experience from prime matter or nature (*prakṛti*).<sup>1</sup> Gerald Larson in a recent article on *sat-kārya* makes the following conclusion:

In conclusion, therefore, the notion of *satkārya*, in my view, has little to do with Aristotelian material cause or the notion that the effect preexists in the cause in this sense. Rather, *satkārya* appears to function as an explanatory principle for maintaining *prakṛti* as a closed, transforming, self-regulating, intelligible (but not intelligent) whole. . . .<sup>2</sup>

For Vedānta theologians the nonseparation of material causality and efficient causality is a characteristic of Brahman. The correlative of *sat-kārya* is *pariṇāma* or transformation. Through its own essential energy Brahman transforms itself into the world of matter and souls. Brahman is both the ultimate substrate and the efficient cause which orders creation. The transformation of cause into effects and the nonseparation of material and efficient causes gave rise to a particular interpretation of the relationship between Brahman and the world known as difference-in-identity (*bhedābheda*). Not all Vedānta thinkers followed such an interpretation. The Śaṅkara school emphasized the ultimate identity (*abheda*) of everything with Brahman, and the Madhva school stressed the absolute difference (*bheda*) between God and creation. The principal text of Vedānta is Bādarāyaṇa's *Brahma Sūtras*, and the difference-in-identity interpretation of it has been noted already as the most accurate.<sup>3</sup>

Not all difference-in-identity Vedāntins agreed on specifics. Bhāskara believed that the transformation of Brahman into the world is due to temporary conditions, Nimbārka posited certain essential yet distinct energies within Brahman as the source of transformation, and Rāmānuja resorted to a doctrine of Brahman being the soul of a body which it causes to expand into the world. In the context of this study there is no finer difference-in-identity thinker to discuss than Vijñānabhikṣu (fl. ca. 1575) for two reasons: (1) in his commentary on the *Brahma Sūtras* he explained well the Vedānta notion of nonseparation especially as it applies to Brahman being both the material and efficient causes (in fact, he called his

school of Vedānta "Nonseparate Nondualism"); and (2) he is recognized as an apt interpreter and synthesizer of the Sāṅkhya and Yoga schools from which the notion of *sat-kārya* is derived. I am well acquainted with Vijñānabhikṣu's writings since he was the subject of my doctoral dissertation.<sup>4</sup>

It is also my belief that the Indian legacy to religious thought in general is the completeness to which this triple classification of interpretations of the relationship between God and the world unfolded: identity, difference, and difference-in-identity. Within each of these three large metaphysical frameworks or models a variety of theologies resulted from dialogues and debates. The specific contribution of Hinduism, and especially Vedānta, to western thought traditions is the collection of theological and philosophical formulations within the third framework: difference-in-identity.

This triple scheme can be applied elsewhere, and although identity positions are not very numerous in European thought, difference-in-identity interpretations are not uncommon. In my opinion, Bonaventure's theology is a difference-in-identity synthesis, and this is clear when his notion of exemplary causality is examined. The function of Christ as the supreme Exemplar is similar to the function of Brahman as the material cause in Vedānta. Both the formal cause of Bonaventure and the material cause of Vijñānabhikṣu are not separate from the efficient cause. Both theologians ultimately state a doctrine of difference-in-identity between God and creation.

This study, therefore, is first of all an examination and clarification of the highly misleading term "material causality" when applied to a specific category of the Sāṅkhya, Yoga, and Vedānta schools. Secondly, in this study I will show that what material causality allowed certain Vedānta theologians, especially Vijñānabhikṣu, to assert in regard to God and creation, formal causality permitted Bonaventure to state.

Material causality according to Sāṅkhya, Yoga, and Vedānta implies that the effects are simply modifications of the material cause. A real cause produces out of itself equally real effects which are in some way identical yet different from it. The notion of the effect being a transformation of a cause (*sat-kārya*) involves the other Sāṅkhya doctrines of matter, the manifest, the unmanifest, the three qualities, and emanation. Nonexistence cannot be produced, and therefore what is real is (1) manifested and evolved, (2) unmanifested yet evolved, or (3) unmanifested and unevolved. Every potentially existing is an actually existing in the material cause.

The classical formulation of the doctrine of transformation of the cause into real effects is in the *Sāṅkhya Kārikā* by Īśvārakṛṣṇa which was probably written in the first few centuries of the Christian era.<sup>5</sup> *Sāṅkhya Kārikā* 9 states: "Because nonbeing does not cause, because of the need for a material cause, because it is impossible for all things to come from all things, because a thing can only produce what it can produce, and because of the nature of a cause, the effect exists (*sat-kāryam*)."<sup>6</sup> The ultimate source of all things is matter which is unmanifest in a preemanation state and is fully manifested as the world of experience. Through a series of emanations twenty-three other principles of being emerge.

Matter is one of two first principles, with spirit being the other, but spirit is necessarily conscious, witnessing, and passive. Energy and activity belong solely to matter and its evolutes because of three constituent qualities of matter as stated in *Sāṅkhya Kārikā* 12: "The qualities, whose natures are pleasure, pain, and indifference, serve to manifest, activate, and limit; they successively dominate, support, activate, and interact with one another."<sup>7</sup> All manifest and evolved things are composed of these qualities and result from their interaction. This is the teaching of *Sāṅkhya Kārikā* 15-16: "Because of the transformation of particular things, because of homogeneity, because of the power which emerges, because of the distinction between cause and effect, because of the nonseparation of all things, the unmanifest is the cause, and it

functions by the interaction of the three qualities due to the specific nature of each quality as in the case of water."<sup>8</sup>

From the above references, it should be evident that matter is the material cause and that the qualities are the efficient cause. These qualities are not separate from matter, and so in a sense they are identical with the material cause. Gaspar Koelman made this equation in his book on Yoga:

The true ultimate efficient cause is identical with the substrative cause, since only that out of which a thing is made and in which it is latent can efficiently draw out that effect of which it is pregnant.<sup>9</sup>

Yoga thinkers took over the Sāṅkhya scheme and developed methods for retracing the effects back to matter in order to isolate the pure awareness of spirit from the remaining factors of experience. The greatest expositor of Yoga was Vyāsa, and in his commentary on *Yoga Sūtras* 4.12 he stated something similar:

An efficient cause is capable of making only an actually existing result present, but not of producing something new. The efficient cause, when fully established, gives aid to the ordered manifestation of its object, but it does not cause it to be created anew.<sup>10</sup>

Through the ceaseless activity of the three qualities more and more effects appear out of the material substrate and return to it.

Vijñānabhikṣu did not write a commentary on the *Sāṅkhya Kārikā*, but he did produce one on the much later *Sāṅkhya Sūtras*, which he called the *Sāṅkhya Pravacana Bhāṣya*, and a summary of Sāṅkhya entitled *Sāṅkhya Sāra*. Furthermore, Bhikṣu amplified Vyāsa's commentary on the *Yoga Sūtras* in his *Yoga Vārtika* and summarized Yoga in his masterpiece the *Yoga Sāra Saṅgraha*. I can continue, therefore, to discuss

the Sāṅkhya-Yoga notion of material causality through Vijnānabhikṣu's own words.

In his commentary on *Sāṅkhya Sūtras* 5.60 Bhikṣu defined the *sat-kārya* theory, much like Vyāsa did, as the making present of something: "If a manifestation is said to be the acquisition of the present state by breaking up the past state, then this is the doctrine of the transformation of a real effect."<sup>11</sup> Past and future states of a cause, manifested in effects, are simply the breaking up and the not-yet-existing respectively of these effects.<sup>12</sup> The implications of this theory for Bhikṣu were significant, namely, the ultimate nondifference of cause and effect and the validity of the world of experience. From the Buddhists and the followers of Śaṅkara's Nondual Vedānta a challenge had been issued to other Vedānta theologians that, because of the ultimate nondifference of all things, this world is illusory. Bhikṣu saw in the same Scriptures and dogmatic statements a teaching of the transformation of real effects:

It is taught in Scripture that prior to production there is no difference between cause and effect. This means that since the effect is real, its production is not unreal. For if the effect is unreal, then the identity of what is real with what is unreal is inconclusive. These Scriptures teach the identity of cause and effects before production: "Truly at that time this world was unmanifested" (*Br.U.* 1.4.7); "In the beginning, my dear, this world was just being" (*Ch.U.* 6.2.1); "Verily, in the beginning this world was just darkness" (*Mait.U.* 5.2); and "In the beginning this world was just water" (*Br.U.* 5.5.1).<sup>13</sup>

For Sāṅkhya, Bhikṣu admitted, the root cause is matter as he stated in reference to *Sāṅkhya Sūtras* 1.67: "In respect to a root, a root is rootless by not having a root; matter, the root material of the twenty-three principles, is without a root."<sup>14</sup> As the root cause, matter is the first cause in which

all effects are immanent: "When the former goes away, the latter cannot survive because an effect is apprehended as immanent in the material cause."<sup>15</sup> The author of the *Sāṅkhya Sūtras* clearly states in aphorism 1.41 that mere antecedence is not a sufficient definition for material causality, and Bhikṣu in his commentary remarks that both the material cause and the efficient cause are antecedent and "that the distinction between the material cause and the efficient cause is accepted by everyone."<sup>16</sup> Later, when commenting on *Sāṅkhya Sūtras* 1.81, he explained this distinction further: "The actions of the efficient cause are not the root cause because what is the material cause does not conform to the substances known as the qualities."<sup>17</sup>

In Sāṅkhya-Yoga, cognition and materiality are not entirely distinct for in the instinctive principle, matter's first evolute, is the capacity for discrimination. To explain the makeup of all instances of materiality, whether cognitive or physical, the three qualities were used. These qualities are the kinds of elements which constitute the things of experience: intelligence, energy, and mass. In physical matter the predominant elements are energy and mass while in cognitive structures the predominant element is intelligence.

Bhikṣu explained intelligence, energy, and mass as causal substances making up matter and as having many manifestations with varying amounts of their "stuff." His argument was that there would not be any similarity or dissimilarity between the things of the world if they were merely effects of the three qualities. Things are in fact alike and different because they are composed of actual amounts of these three substances. What is at the bottom of this interpretation of the three qualities as substances is an attempt to explain psychic energy, physical energy, and the lack of them in all the cognitive and physical manifestations of matter:

The three qualities, formed of the substances of intelligence and the rest, are found here; hence the triad of qualities. Therefore, intelligence and the

other qualities abide in entities, like the instinctive principle, in the form of a cause; the same intelligence and the others abide in matter in the form of the triple quality composite like trees in a forest. This is how we are to understand it.<sup>18</sup>

The three qualities act as causal substances in matter and each of its evolutes in the form of intelligence, energy, and inertia but also act as qualities of matter and its effects as luminosity, motion, and heaviness. The three qualities in causal form, therefore, are the genuine efficient cause as Bhikṣu stated in his *Yoga Vārttika* 4.3: "Since the causal reason for impelling is due generally to just the qualities, matter's independence is established."<sup>19</sup> In the Sāṅkhya vision, no god acts as the first efficient cause. Furthermore, the qualities are not separate from matter but can be distinguished conceptually as the efficient cause apart from the material cause. The material cause, therefore, has its own ordering intelligibility, its own energy to transform itself into things, and its own principle of limitation in the three qualities respectively. Matter, as cause and effect, is in European scholastic terminology both *natura naturans* and *natura naturata*.

Sāṅkhya is an atheistic school in its classical formulation. In Yoga, God is not a creator but a most excellent spirit who is a grace-giving model for aspirants. In the *Yoga Vārttika* 4.3 Bhikṣu stated matter's nonseparation from its effects in a way suitable to Yoga thought:

Hence matter alone, joined with its effects, in respect to transformation is established as the cause and independent. . . . Therefore matter alone is the cause of the world, but time, action, and God are brought forth as energies generating the effects of matter.<sup>20</sup>

One of Vijñānabhikṣu's great achievements was a theological

reconciliation of Sāṅkhya, Yoga, and Vedānta. He was certainly not the first Hindu theologian who attempted to reconcile various orthodox schools, but scholars writing on Sāṅkhya and Yoga must take his interpretations of these two schools into account. This is some measure of his success.

Vijñānabhikṣu was primarily a Vedānta theologian, and in his commentary on *Brahma Sūtras* 1.1.2, which runs nearly 40 pages and which I translated in my doctoral dissertation, he stated the Vedānta views on material and efficient causality in respect to Brahman. Bādarāyaṇa's second aphorism of his *Brahma Sūtras* reads with the following additions: "(Brahman is that) from which the origin and so forth (existence, development, maturation, deterioration, and destruction) of this (world proceeds)."<sup>21</sup>

The first major step which Vijñānabhikṣu took in his commentary on the second aphorism was to identify Brahman as the supporting cause (*adhiṣṭhāna kāraṇa*) of the world. Bhikṣu defined a supporting cause as "the one from which the material cause is not separate and by which the latter, being supported, is transformed into the mode of an effect."<sup>22</sup> This is the root cause in his system, and it upholds everything which is derived from the material cause by being the sole witness of matter.

In the primordial, unmanifested state everything exists in Brahman through a union of nonseparation. This kind of nonseparation is a pre-causal condition before cause and effect are distinguished, and hence in this state Brahman is unmodified. The material cause, on the other hand, which has been transformed into an effect of the supporting cause, is a modifiable cause with its three qualities as nonseparate constituents. Matter is also qualified by its evolutes which in a pristine condition are nonseparate too. Already, then, the theologian has distinguished two kinds of nonseparation—between constituents and between cause and effect.

Even though Brahman is pure consciousness, it can also be considered the material cause of the world and identical with the world because both the material cause and the world are

its nonseparate effects; however, the world does not directly emanate from Brahman. Brahman, then, is not the immediate source of imperfection and evil because the things of the world only indirectly emanate from the supporting cause. At the end of his discussion on supporting causality Bhikṣu remarked that he would refute later in his commentary on the *Brahma Sūtras* the theory of the direct transformation of Brahman. He was well aware that if the things of the world are direct transformations of Brahman, then the problem of evil would be devastating to his theology.

Not only is material causality indistinguishable from Brahman as the supporting cause, but so too is efficient causality. Vijñānabhikṣu considered that he was positing a fourth category with his supporting cause. The other three causes are constituent (*samavāyi*), nonconstituent (*asamavāyi*), and efficient (*nimitta*). As the support of all these, Brahman is nonseparate and hence identical with the efficient cause too. Once the efficient cause is distinguished from Brahman, then that cause is modified by Brahman's essential power as an attribute. Brahman the creator is then the modified Brahman.

These three causes, constituent, nonconstituent, and efficient, are categories belonging not to Sāṅkhya, Yoga, or Vedānta, but to three other schools of thought: Nyāya, Vaiśeṣika, and Mīmāṃsā. The constituent cause is more properly what is termed "material cause" in European thought for it is the substrate in which a change takes place. Nyāya-Vaiśeṣika held a doctrine of *asat-kārya* or that the effect is not a transformation of a cause. The efficient cause is still that by which a change takes place while the nonconstituent cause is an aid to the material cause. For example, yarn is the material cause of cloth, the weaver is the efficient cause, and the texture and color are nonconstituent causes.

Intrinsic difference has a special place in the theology of Vijñānabhikṣu: "The relationship between support and supported existing in the self prior to any attachment of modifiers cannot be postulated without an intrinsic difference."<sup>23</sup> Nonseparation in the individual self is much the same as it is

with Brahman which is the supreme Self. As the supporting cause, Brahman is the substance of the world. First by a separation of its various energies and then by their modification to perform as different causes, Brahman gives rise to the various conscious and unconscious things in the world. Everything remains substantially identical with Brahman.

In his commentary on Bādarāyaṇa's second aphorism, Bhikṣu clearly stated that the principal meaning of the term Brahman "is completely different from matter and spirit."<sup>24</sup> Since Bhikṣu believed that Sāṅkhya's doctrine of the distinction of spirit from matter was the ultimate truth for self-liberation and since he accepted, for the most part, Sāṅkhya metaphysics, the relationship between Brahman and matter and spirit was one way in which he presented his doctrine of Brahman.

Matter and spirit are energies and their causal function is defined through material causality. Matter remains the material cause and root cause of the twenty-three principles because it is the source of the unfolding of the world. Matter is activated through its joining with spirit, and because spirit is the silent witness of these emanations, matter acts for the benefit of spirit's observation. God is the efficient cause of the world through its uniting of matter and spirit: "Now I maintain that the joining of matter and spirit is effected by God. . . ." <sup>25</sup> This is a definite departure from the twenty-five principle system of the *Sāṅkhya Sūtras*, twenty-three evolutes plus matter and spirit, and an opting for a theism with twenty-six principles. Furthermore, the three qualities become secondary or instrumental causes, since Brahman effectively joins matter and spirit and orders creation.

Brahman, therefore, is equated with both material and efficient causality because it supports these two and shares their functions. Vijñānabhikṣu concluded in connection with this: "Brahman is the universal cause through its various attributes because it is endowed with all energies."<sup>26</sup> Hence, it may be assumed that Brahman's main attribute is power, composed of various nonseparate energies, matter and spirit

clearly being two such energies, and that this essential power is manifested as a quality of the modified Brahman, or God, who effects the conjunction of matter and spirit.

This interpretation of Brahman as the supporting cause, and therefore as the efficient and material causes of the world, is not only a statement of the ultimate nonseparation of the material cause from the efficient cause and a reiteration of the Sāṅkhya doctrine of transformation. Essential to Bhikṣu's theology is a difference-in-identity relation between God and the world. Even the Nondualist Śaṅkara, who departed from the difference-in-identity characteristic of Vedānta religious thought, admitted the similarity between Sāṅkhya and Vedānta on the notion of causality: "It (Sāṅkhya) approaches Vedānta since it admits of the cause not being different from the effect."<sup>27</sup> Bhāskara, a difference-in-identity Vedāntin, whose writings represent the first known refutation of Śaṅkara's Nondualism, restated the transformation theory: "An effect is only a state of the cause; both are different and non-different. . . ."<sup>28</sup> All effects are inherent in Brahman which is not only their source (material cause) but their intelligent source (efficient cause). In both Sāṅkhya and Vedānta the efficient cause, being the three qualities in Sāṅkhya and Brahman the creator in Vedānta, is nonseparate from the material cause.

Another difference-in-identity Vedāntin, Rāmānuja, stated it this way:

Brahman is not just the efficient cause, but also only Brahman is the material cause. If Brahman was just the efficient cause of the world, then the whole world would not be known from a knowledge of it. An effect is not a different substance but the cause obtaining another state.<sup>29</sup>

Rāmānuja argued against several other difference-in-identity interpretations, but he did formulate the same kind of position. The entire universe of souls and matter and its evolutes

constitute a body, and Brahman is the soul of this body. From this perspective he has given one of the most concise and marvellous descriptions of transformation:

This is how transformation is explained. The supreme Brahman is concentrated goodness, being wholly adverse to evil, distinguished from all beings other than itself. It is all-knowing, the realizer of all wishes, possessed of all its wishes, unlimited and sovereign bliss. Having for its body the entire universe of all conscious and unconscious things, which subserves its cosmic play, it is the soul of that body. This universe which is its body survives as an extremely subtle unconscious reality, known as heaviness, through the successive regression of matter's evolutes, the elements, the ego, etc. With this body of heaviness, now arrived at an extremely subtle form, such that it cannot be considered as differentiated, then the supreme Brahman attains a condition of oneness. Through the thought "may I become the world body constituted of the unconscious and conscious being, distinguished as before by name and form," it transforms itself into this world body through entering one evolute of matter after another. This is the teaching of transformation in all the Scriptures.<sup>30</sup>

\* \* \*

Bonaventure's (1221-1274) doctrine of exemplarism is constructed on the difference-in-identity model too. Unity and plurality in God is resolved through a coincidence of opposites because God is both pure Being and self-diffusive Good. Through the generation of the Son, who is the supreme Exemplar and the total expression of all that is possible, the unity and plurality of the world is resolved in God too.

These works are the major sources for this discussion of Bonaventure: *Breviloquium*, *Collationes in Hexaëmeron*, *Commentarius in Primum Librum Sententiarum*, *Itinerarium*

*Mentis in Deum, Opusculum de Reductione Artium ad Theologiam*, and *Questiones Disputatae de Scientia Christi* and *de Mysterio Trinitate*. The suggestion of difference-in-identity, which is made here, has already been proposed by a present-day scholar of Bonaventure.<sup>31</sup>

Using the name in Exodus 3:14, Bonaventure stated that "I am Who am" is the most perfect name for God.<sup>32</sup> Because all things depend on him, God is the ground of everything and therefore is the first principle of being. God is perfect and pure Being which is an indivisible unity, but Bonaventure realized that this concept of unity expands to include the indivision and simplicity of what originates and the completeness and inseparability of what is originated:

For indivision is unity; however, unity exists in the originating and in the originated, in universals and in particulars, in the will and in nature. Unity in the originating is simplicity; in the composite or in the originated it is wholeness or fullness; in universals it is conformity; in particulars it is countlessness; in the will it is unanimity; and in nature it is inseparability.<sup>33</sup>

Already the language of difference-in-identity is recognizable. The relationship between God and the world under the aspect of God as pure Being has been set up. There is originating, universal, and willing being, and there is originated, particular, and ordered or created being. Hence being can exist in two ways: as subsistent, self-modeled, and self-intended or as contingent, modeled after another, and tending towards another. Also God operates in three orders: origination, exemplification, and termination.<sup>34</sup> These three orders correspond to the functions of the Trinity of Persons respectively, and the two aspects of the first principle, as the pure Being and as the Trinity, coincide.

The explanation of the one God and the Trinity by Bonaventure repeats the teaching of *Brahma Sūtras* 1.1.2: Brahman is the origin, preservation, and destruction of the

world. The first principle through the two modes of perfect emanation, which are generation and spiration, unfolds into God as Father, Son, and Holy Spirit. They stand for the efficient, exemplary, and final principles of the world. The divine essence remains the same in the double emanation. It is one, simple, eternal, immutable, yet it includes fecundity, likeness, and inseparability.

A closer examination of the generation of the Son further elucidates the dual aspect of God and his relationship with the manifest world, because for Bonaventure Christ is the metaphysical medium and through him the three orders of being are related: emanation, exemplification, and return.<sup>35</sup> From all eternity the Father begets the Son, who is his likeness and also expresses all that he can do. This total expression of his Being in the image of the Son is called divine art by Bonaventure.<sup>36</sup> Therefore the nature of God is the same, but the mission and manifestation of each Person is different. The Father sends the Son and expresses the totality of creation through him while the Son, being the Exemplar of everything, is the cause of the return of everything to God in the Spirit.

Bonaventure did not use the same language to describe the relationship between God and the world as the Hindu theologians of the Vedānta school. Although God's essence is pure Being and is all-inclusive, God is not the essence of everything; nevertheless, he is the most excellent, universal, and sufficient cause of all essences. God's essence is one, but it is infinite and multiple in its effects.<sup>37</sup> If the difference-in-identity theme is operative in the relationship between God and the world in Bonaventure's theology, then it should be discernible in his doctrine of exemplarism.

In his commentary on the *Sentences* of Peter Lombard, Bonaventure made the formal connection between divine fecundity and the Person of the Father.<sup>38</sup> The Father is primarily fecund, but this fecundity is expressed throughout the Trinity because the three Persons are God who is the pure Being and self-diffusive Good. Therefore, we can distinguish

two fountains of being: the Father who is the source of the Trinitarian processions and the Trinity as a whole which is the source of creation.<sup>39</sup> What Bonaventure has done is to make a real connection between the fullness of the Trinitarian processes of self-expression and return and the fullness of the creation of the world.

In his Trinitarian theology Bonaventure described the generation of the Son as the production of an equal and consubstantial likeness. The generation is a production from the nature of God, and the Son shares the essence of the Father. Also the Son has all the power and potentiality of the Father because the Father not only communicates his likeness to the Son but also expresses all the things which he could make: "For the Father, as it is said, generated one similar to himself, namely the Word, coeternal with himself, and he expressed his own likeness and, consequently, expressed all the things which he could express."<sup>40</sup>

Christ is the eternal art of the Father and is not separate from him. The created effects of God, which constitute the world, are distinguished from one another through their forms, and hence the creative art involves the giving of a form and individual properties to each thing. God necessarily possesses the ideal forms.<sup>41</sup> God, therefore, is both a first cause and an immediate cause of everything. By possessing all the ideal forms, God is the exemplary cause, and this establishes an intimate relation between God and the world. The world is a pattern of the divine art and is most real in its ideal form as the eternal divine ideas.

In discussing the relationship between God and the creature, Bonaventure used these terms: image, trace, likeness, shadow, echo, and representation. For example, he stated that the universe is like a book reflecting and representing the Trinity on three levels: the trace, the image, and the likeness. All creatures are traces while all intellectual creatures are images. Although at times the term "likeness" is used in special reference to the Son, Bonaventure also used it for those who are "God-conformed," these intellectual creatures

who spiritually conform themselves to God. Thus an ascending scale of representation is indicated with the most material creation at the base and the most spiritual at the tip.

In the *Itinerarium* he described traces as material, temporal, and external while images are everlasting, spiritual, and internal.<sup>42</sup> Later in the same book he listed these terms as synonyms for the creatures in the sensible world: shadow, echo, image, vestige, likeness, and representation.<sup>43</sup> All these terms refer to what is produced from the divine art, which is the efficient, exemplary, and final cause.

Bonaventure's language of likeness, shadow, image, etc. should not be confusing to us. When I mentioned earlier that there is an intimate relationship between God and the world due to the whole of creation being totally expressed in the Son who is the locus of the ideal forms or divine ideas, I meant that all of creation is real because it exists in ideal forms. Anything is real because it exists in the divine ideas:

... for the exemplary likeness more perfectly expresses the thing than the caused thing itself expresses itself. On account of this God more perfectly knows things through their likenesses than he would know them through their essences; and angels more perfectly know in the Word than according to their own kind.<sup>44</sup>

These ideal forms are not just universals, but the Son's embrace of the totality of creation in the divine ideas includes individual things in their own peculiarities.<sup>45</sup> Bonaventure could be no clearer when he says that due to the exemplary mode of being things actually are in God: "Likewise it can be said to follow that things are actually in God in the exemplary order and potentially according to the order of creation because they can be produced."<sup>46</sup> In the light of his mystical theology Bonaventure was prompted to say: "I will see myself better in God than in my very self."<sup>47</sup>

Bonaventure employs the language of difference-in-identity in his descriptions of the relationship between God and his

creatures. The divine essence is all-present, surrounding, penetrating. It is the center and the circumference of all things. Being simple it is wholly interior to all things, but being omnipotent it is entirely exterior to them. Furthermore, because God is all-inclusive, he is all-in-all. Although things are many and God is one, there is in his simple unity all power, all exemplification, and all communicability.<sup>48</sup> God, therefore, is a differentiated unity in two senses: (1) a Trinity of Persons; and (2) an Exemplar of the whole of creation both generically and specifically. Bonaventure's doctrine of exemplarism does not, therefore, set up a polarity between God and the world, but it represents an attempt, and a thoroughly Christian one, to define the relationship between God and his creatures in such a way as to encompass the relationships of identity and difference.

\* \* \*

Difference-in-identity systems of thought in India rest upon the notion of the material cause being more than an inactive substrate in which change takes place. Ultimately this meant for Vedānta a borrowing of Sāṅkhya's notion of real transformation. Matter possesses various qualities and is the material cause which is not separate from the efficient cause. In the Vedānta systems which were truly statements of the difference-in-identity between Brahman and the world, matter retained its qualities of intelligence, energy, and inertia; but they no longer were seen to function as the primary efficient cause. That was Brahman in its aspect as the creator. Yet material causality was not separate from efficient causality.

What material causality did for Vedānta theologians like Vijñānabhikṣu, exemplary causality did for Bonaventure. The exemplary cause is not separate from the efficient cause through the Son. Both are rooted in the nonseparation of Persons in the Trinity. Through this Bonaventure was able to state a position which respected both the unity and the difference between God and creation. Creation is not an absolute

separation from God because all things exist really and immanently in the exemplary condition of the Trinitarian processions and in the Son who is the Supreme Exemplar.

#### NOTES

1. Betty Heimann, *Facets of Indian Thought* (New York: Schocken Books, 1964), p. 59, writes: "The *causa efficiens*, the agent, and the *causa materialis*, the material cause, are in Indian philosophy not strictly separated from each other. . . . In the standard examples, the threads are shown as the *causa efficiens* of the effect, the cloth. . . . All effects, both subjects and objects, are potentially contained in the great reservoir of primary Matter before, and after, their actual manifestation. *Prakṛti* is their common efficient and material cause."

3. See Surendranath Dasgupta, *A History of Indian Philosophy*, 5 Vols. (Cambridge: Cambridge University Press, 1922-55), Vol. 2, p. 42: "... Bādarāyaṇa's philosophy was some kind of *bhedābheda-vāda* or a theory of transcendence and immanence of God (Brahman)—even in the light of Śaṅkara's own commentary. He believed that the world was the product of a real transformation of Brahman, or rather of His powers and energies (*śakti*)." Also in *ibid.*, Vol. 3, p. 105: "The *bhedābheda* interpretation of the *Brahma-sūtras* is in all probability earlier than the monistic interpretation introduced by Śaṅkara." P. M. Modi, *A Critique of the Brahmasūtra* (3.2.11-4), 2 parts (Bhavnagar, India: by the author, 1943-56), 1.xix-xx, made the same point but more cryptically: "The most essential piece of information discovered on this point is that according to the Sūtrakāra the *Upaniṣads* described the personal aspect of Brahman with the attributes of the impersonal and *vice versa* (*Bra. Sū.* III.3.37-42). It is on this fact that the Sūtrakāra bases his doctrine of two aspects of *absolutely equal status* and gives a complete *option of choice* to a *mumukṣu* to select either of the two, the immediate goal being the same."

44. "... illa enim similitudo exemplaris perfectius exprimit rem, quam ipsa res causata exprimat se ipsam. Et propter hoc Deus perfectum cognoscit res per similitudines illas, quam cognosceret per suas essentias; et Angeli perfectius cognoscunt in Verbo quam in proprio genere." *Sc. Chr.*, q. 2, ad 9 (V.10).
45. "Nam corporalis est similitudo spiritualis, et compositi est similitudo simplex, etiam in creaturis; ideo non oportet, quod una idea sit altera simplicior vel prior. Similitudo tamen secundum rationem intelligendi habet proprietatem ideati secundum distinctionem..." *I Sent.*, d. 35, a. un., q. 4, con. (I.610).
46. "Similiter ad sequens, dicendum, quod ratione exemplaris res actualiter sunt in Deo; ratione creationis potentialiter, quia possunt produci." *Ibid.*, d. 36, a. un., q. 1, con. (I.621).
47. "Unde melius videbo me in Deo quam in me ipso." *Hexaem.*, XII.9 (V.386).
48. "Quia aeternum et praesentissimum, ideo omnes durationes ambit et intrat, quasi simul existens earum centrum et circumferentia.— Quia simplicissimum et maximum, ideo totum intra omnia et totum extra, ...—Quia vero est summe unum et omnimodum, ideo est omnia in omnibus, quamvis omnia sint multa, et ipsum non sit nisi unum; et hoc, quia per simplicissimam ininitatem, serenissimam veritatem et sincerissimam bonitatem est in eo omnis virtusitas, omnis exemplaritas et omnis communicabilitas..." *Itin.*, c. 5, n. 8 (V.310).

## *Cit and Nous*

---

Paul Hacker

*University of Münster  
Westfalen, West Germany*

Neoplatonism has more than once been compared with Indian philosophy, and especially with that pluriform variety of Indian thought which is comprised under the designation of Vedānta, or, as I prefer to call it when speaking of the later interpretations of the *Upaniṣads*, of Vedāntism. Historical dependence has been asserted especially in the case of Plotinus. But I wish to state right from the outset that I do not think that such dependence is proven in any way, though I would not deny the possibility that Plotinus may have had a vague and dim knowledge of one or two Vedāntic doctrines, mediated to him through inexact translations or accounts.

Much more important than the fascinating resemblance of the two spirit-oriented philosophies is the fact that in spite of the common primacy of the spiritual, the conceptual formations and structures are so different that the distinctive terms

First published in Paul Hacker, *Kleine Schriften*. Edited by Lambert Schmithausen as Vol. 15 of the publications of the Glasenapp-Stiftung, Wiesbaden: Franz Steiner Verlag, 1977, pp. 320-337.

of the Indian school of thought are almost normally misunderstood in the West. Let me illustrate this possibility of misunderstanding by what is perhaps the most striking example. There is no doubt that the German Paul Deussen was in his time the deepest specialist of Vedāntism in the West. Now in this scholar's book, *The System of the Vedānta*, published in German in 1883, we read in a footnote (54, on page 95) that in a certain passage of Śaṅkara's *Brahmasūtrabhāṣya* there occurs "the monstrosity of an absolute perception," that is, the postulate of "a subject without an object." It seems incredible, but it is simply a fact, first, that precisely this "monstrosity" forms the very center of the system of monistic Vedāntism, of which Deussen undertook to give an account; secondly, that the most specialized specialist misunderstood the most central concept of the subject of his studies. Now it is this very "monstrosity" which I intend to elucidate in the following, in confrontation with Neoplatonism.

As I have already hinted, this confrontation is not meant to detect historical influences. It is simply an attempt to clarify concepts. Such clarification is a necessary prerequisite for a fruitful interpenetration of Indian and Western thinking in metaphysical speculation, nay, it is already a timid beginning of such interpenetration.

The comparison of Vedānta and Vedāntism with Neoplatonism is beset with difficulties. One of these consists in the enormous differences of the conceptual and argumentative stage of development in the two schools. I will try to explain what I mean by this statement. In the *Upaniṣads*, and I am thinking here especially of the later ones—*Kātha*, *Śvetāśvatara*, *Mundaka*, *Maitrī*—and a few late passages in earlier *Upaniṣads*, in these texts we find concepts which notwithstanding their profundity are in a way indistinct, so that they are hard to define. In addition, argumentation is in quite a rudimentary state. On the other hand, later Vedāntism, beginning from the

time of Śaṅkara, i.e., from the 7th century, combines concepts that are clear-cut and definable, though not very differentiated, with a highly developed argumentation. Now in Neoplatonism, especially in Plotinus, it is extremely difficult, if not impossible, to define with precision the content even of the leading terms,<sup>1</sup> while, on the other hand, conceptual variety and argumentation are full-grown and refined. So we are confronted with an incongruity in either case: whether we compare with Neoplatonism the *Upaniṣads*, i.e., Vedānta in the restricted sense of the word, or Vedāntism, i.e., the philosophy grown on the basis of the *Upaniṣads*.

Realization of the difficulties and incongruities is apt to deter one altogether from undertaking a comparison, and I frankly confess that in the months while thinking of attending the congress of the Society for Neoplatonic Studies, I was often tempted to renounce writing a paper to be read at the congress. At last, I took a somewhat desperate resolution. It had been clear from the time of my invitation that my task could not be to contribute to the knowledge of Neoplatonism, since I am far from being a specialist in this field. I wish to elucidate an *Indian* concept before an audience familiar with Neoplatonism. So I eventually resolved to confine myself, on the Neoplatonic side, to that brief handbook which recommends itself also on account of the prominent role it played for many centuries in the history of European thought. I mean to Proclus's *Stoicheiōstis theologikē*. Starting from, or on the basis of, or against the background of this book, with references also to Plotinus, I will try to explain the difference of those two concepts which may be, and have been, translated by the same Western word, viz., by "spirit," the concepts of Sanskrit *cit* and Greek *noûs*. This will, of course, also necessitate digressions to other related concepts on both sides. In referring to Proclus I gratefully used the admirable edition by E. R. Dodds, with his translation and commentary, without, however, sharing his opinion that such business belongs to the "Wissenschaft des Nichtwissen-swerthen," i.e., to the science of that which is not worth

knowing. For Plotinus I used the excellent edition, with German translation, published by F. Meiner.

In the title of this paper I have quoted an Indian and a Greek term, *cit* and *noûs*. But this was more or less a make-shift. The meanings of the two words are connected by little more than the fact that both are usually translated by one and the same Western word. Still, I would justify the inclusion of the two words in the title. For, first, both the Indian and the Greek words do express something like what we mean when we speak of "Spirit" in philosophy; secondly, I wish to explain, or at least to make a first attempt at explaining, to the student of Neoplatonism, what is meant by *cit*, and to the Indologist, by what means the Neoplatonist in his maturest stage tried to give approximate expression to that reality which the Indian term faces.

We may start from Neoplatonism, but since the meaning of the Indian term differs very much from that of the Greek one, it would be bewildering to start directly from the Greek term. Some metaphysical propositions of Proclus's book seem to provide promising starting points.

I take proposition 15 as such a starting point: "All that is capable of reverting upon itself is incorporeal" (Πάν τὸ πρὸς ἑαυτὸ ἐπιστροφικὸν ἀσώματον ἔστιν). The notion, occurring in this proposition, of reverting upon oneself, was perhaps first conceived by the Stoics<sup>2</sup> and then taken over by the Neoplatonists. Now I could stop short here, remarking curtly that the Advaitic Vedāntist explicitly dismisses the notion of epistemological reflexivity as illogical, and that, therefore, further discussion is pointless because "East is East and West is West and never the twain will meet."

The concept of ἐπιστροφή πρὸς (or: εἰς) ἑαυτόν has survived in Thomism down to our day. Proclus holds that this capability of reversion upon itself is an indication of an entity's being incorporeal, and the same argument recurs in St. Thomas' *Summa contra gentiles*<sup>3</sup> (II.49 Marietti no. 1254). The difference between Thomas and Proclus is that for Proclus there are three incorporeal entities, namely the One, the

Spirit, and the Soul, each subordinated to the preceding (proposition 20), while for Thomas the only incorporeal thing envisaged here is the *intellectus* or, more exactly, the soul of which the *intellectus* is a part.

Let me first explain *why* the idea of epistemological reflexivity is alien to Vedāntic thought (I am not speaking of Indian thought in general). At a very early time, probably in the first half of the last millennium before Christ, at the latest one or two centuries earlier than 500 B.C., one of those thinkers whose speculations were handed down in the *Upaniṣads* conceived a thought that, in my opinion, belongs to the greatest achievements of philosophy, both Eastern and Western. The clearest formulation of this thought is recorded at *Bṛhadāraṇyaka Upaniṣad* 3.4.2, but similar statements recur in four passages of the second, third, and fourth books of the same *Upaniṣad* (2.4.14; 3.7.23; 3.8.11; 4.5.15). This formulation reads (with a slight abbreviation): "You cannot see him who sees vision, . . . you cannot know him who knows knowledge" (*na dr̥ṣṭer draṣṭāraṃ paśyeh, . . . na vijñāter vijñātāraṃ vijāniyāḥ*). I think the formulation makes the idea conveyed appear self-evident. That which makes knowledge possible—knowledge of all kinds, sensorial perception as well as mental insight and discursive thinking—the principle which makes this possible cannot naturally be grasped or comprehended by that of which it is the very basis of existence. Whatever names we may give to the principle that makes both mental and sensuous acts or events possible, whether we call it consciousness or spirit or thought or knowledge, it is absurd to assume that this principle should need an act of knowledge in order to attain that state which we call "to be known" or "to be manifest." It is absurd because that which makes a thing possible, or is the basis of it, cannot possibly itself be made possible by the thing which it makes possible. Such an absurdity, however, would happen in epistemological reflexivity.

Nevertheless it is inconceivable that the greatest thinkers of the West should for centuries have acquiesced in a blatant absurdity. I am convinced that the Greeks who coined the

term "reflection upon oneself" actually faced a reality. But they did not view it from the same angle as the Indians did and accordingly expressed it in a linguistic form totally different from the Vedāntist term. What Proclus means by "reflection upon itself" is the self-manifestation, the self-revealing nature of the spiritual, which Proclus designates by the negative term "incorporeal"—a term which is used by the Vedāntists also. In terms of post-Upaniṣadic Vedāntism, Spirit is not in need of a subject-object relationship in order to become manifest.

Precisely for this argument it is helpful for the thinker who intends to investigate the nature of Spirit, to have, as the Indians had from very early times, a reflex awareness of the subject-object relationship as an element of the structure of reality. For the negative proposition, "Spirit can never become an object," provides a vigorous support to the positive statement, "Spirit is self-revealing." The denial of objectivity on the part of spirit naturally involves its proximity to the subject of knowledge. But according to the theory of Advaitic Vedāntism the actual subject of knowledge is not spirit in its purity but spirit somehow intermingled with an objective element. I will revert to this point later.

The self-manifestation of the spirit is expressed by an old term, stemming from mythic thinking and, through a long history, eventually developed into one of the finest intellectual achievements of India. Like "reflection upon oneself" its expression is a metaphor, but, I think, a much more apposite one, namely "self-luminous," in Sanskrit *svayam-jyotis* or *svayam-prakāśa*. "Light," "shining" is a self-explanatory and widely used metaphor to denote all acts and states of consciousness and cognition and perception. "Self-luminosity" implies both the spirit's awareness of itself and its capability of making objects, both material and mental, appear in the range of consciousness. Here we are considering self-luminosity primarily from the ontological point of view (its epistemological relevance, in the Vedāntist context, will be studied later).

Taking up the comparison with Neoplatonism, we find that the light metaphor does not seem to be restricted there to states and events in the domain of consciousness or knowledge. The word *ἐλαμποις*, e.g., has in Proclus's *Stoicheiōsis* always a purely ontological sense. However, there is a philosophical aspect that may be called epistemological ontology. If viewed from this aspect, ■ most surprising similarity between *cit* or *ātman* and *noûs* becomes perceptible. All the characteristics of self-luminosity are ascribed to *noûs* in a treatise of Plotinus (*Enn.* V.3.8.18-42), and besides luminosity "seeing" is also predicated of *noûs*, namely, "seeing," which is also a characteristic of spirit in Vedāntism and of which I will treat later.

We must, however, bear in mind that the comparability of the passage presupposes our detaching it from its context. For the context is purely Neoplatonic: it speaks of the "Intelligible World" and the relationship of Soul to Spirit—two themes entirely foreign to Vedāntic thought. Nevertheless, the similarity is surely significant, and the more so because the contexts in the two cultures are so different.

I will now translate an excerpt from the relevant passage in Plotinus, omitting ideas to which nothing corresponds in Vedāntism.

It is Spirit which sees [*νοῦς δὲ ὁρᾷ*]. . . . He who has received the light of the true things sees, as it were, the visible things in a higher degree. . . . The life and the activity in Spirit are the Primal Light which primarily shines for itself and is brilliancy to itself, illuminating and simultaneously being illuminated, the true spirit-content, cognizing and being cognized, being seen by [or: for] itself and not being in need of anything else for seeing, to itself self-sufficient for seeing—for that which it sees is itself being known also from our side through even that, so that even from our side its knowledge comes to pass through itself. [*Enn.* V.3.8.34-44]<sup>4</sup>

Even here, where the similarity is so impressive, the differences between the Vedāntist and Neoplatonic views must not be overlooked. The light with which Spirit irradiates Soul has a content, which is the "light of the true things," "That which is truly spirit—content" (τὸ ἀληθῶς νοητόν), the Ideal Forms of the Intelligible World. The thought pattern of spiritual reflexivity, too, so foreign to Vedāntism, is not absent from our passage. Moreover, the concept of *life* occurring here does not have any function in the system of later Vedāntism. Nevertheless, the concept of self-revelation or self-luminosity is brought out with clarity and hymnic admiration. Parallels like these should be given due attention in ontologico-metaphysical as well as in epistemologico-metaphysical speculation.

The Neoplatonist's view that the intelligible light of *noûs* has a content, *noûs* containing all Platonic Ideas, makes us understand why in his mind Spirit's reflection upon itself is not an absurdity, for Spirit carries, so to speak, its objects of knowledge within itself. By the same token, the Indian view of the contentless plenitude of Spirit (*cit*, *ātman*) can appear to be an absurdity or a "monstrosity" to the Westerner.

The same context also accounts for the difference of meaning when both systems describe the Absolute or the Intelligible as "simple" (ἀπλοῦς, *Stoich.*, prop. 47; *asamhata*, *passim*). In Neoplatonism this "simplicity" does not preclude spirit from being the sum of all Ideal Forms (ὅλος μὲν ὁ νοῦς τὰ πάντα εἶδη; *Enn.* V.9.8.4; πᾶς νοῦς πλήρωμα ὧν εἶδόν; *Stoicheiōsis*, prop. 177).

The Indian *cit*, on the contrary, entirely un-Greek and un-Western, is simple in the strictest sense of this word; it is spirituality or intelligence abstracted from all contents or associates. Obviously the thinkers were aware that this abstraction, though of enormous philosophical relevance, was unknown in everyday life and even in other systems of philosophy. So they saw the need for a new term. In order to denote what they had discovered, they simply chose the root of a verb which means "to be conscious of," "to think,"

namely, the verbal root *cit* (with or without the addition of an *-i*). The derivation from this root, *citta*, on the other hand, denotes the mind in philosophical and non-philosophical parlance.

In proposition 47 of his *Stoicheiōsis*, Proclus speaks of entities that are "self-constituted" (αὐθυπόστατον). What is "self-constituted," is "simple" and "without parts" (ἀμερές); on the other hand, he states that precisely "all that is capable of reversion upon itself" (πρὸς ἑαυτὸ ἐπιτρεπτικόν, prop. 42) is "self-constituted." Now "self-constituted" seems to be exactly the same as what is called in Sanskrit *svatassiddha* (substantive: *svatassiddhi*), i.e., an entity that constitutes itself by itself as existent and manifest, an entity that by itself establishes its existence and manifestation.

If I am right in explaining that the reality intended by the term "reversion upon itself" is the same as what the Indians mean by *svayamprakāśata* or "self-luminosity," then my equation of the Greek concept "self-constituted" with the Indian *svatassiddha* is corroborated, the more so because, first, the two Greek terms are just as closely linked together as the corresponding Indian terms and, secondly, because both the Neoplatonist and the Vedāntist ascribe to the reality in question the further characteristics of being "without temporal origin" (ἀγένετον, Proclus prop. 45), "imperishable" (ἀφθαρτον, prop. 46), "being without parts" (ἀμερές, prop. 47), and "perpetual" (αἰδιον, prop. 48)—corresponding Sanskrit terms, for which a number of synonyms could be substituted, would be *aja*, *akṣaya*, *akhaṇḍa* or *asamhata*, *nitya*. It would be pointless to cite occurrences, because examples abound from the time of the *Upaniṣads*, i.e., a time earlier than 500 B.C., down to the present time, since there are still adherents of Vedāntism.

Let us stop here for a while to survey the results we have so far arrived at in our comparison. We found two points in which the two systems seemed irreconcilable: first, the wider sense of the concept of "simple" in Neoplatonism as compared with Vedāntism. But we will see presently that on this

point the divergent views can be harmonized to some extent if Vedāntist cosmology is taken into consideration. Secondly, we found the concept of *cit*, which at first sight seemed absolutely unique. However, we succeeded in discovering the concept of self-luminosity in Plotinus also, and this is a bridge which makes *cit* accessible, even though Neoplatonism did not undertake the rigid abstraction which severs *cit* from *citta*. On two other points both the Greek and the Indian system seemed to have in view the same reality, though viewing it from very different angles: "reversion upon oneself" corresponds to "self-luminosity"; "incorporeity" stands for "being spiritual." In addition, there were four terms which are simply identical: "devoid of origin," "imperishable," "partless," "perpetual."

I think these agreements suffice to show that what the Neoplatonist aimed at was much the same as the Vedāntist intended to reach: incorporeity as a stage of pure spirit in the case of the Vedāntist; incorporeity as a stage reached through spirit, but since spirit was not understood here with that purity with which the Indians conceived it, it was felt ultimately to transcend Spirit in the direction of the One, which is beyond Spirit (as conceived in Neoplatonism) and beyond Being.

In order to understand both the similarities and the divergencies of the two systems, it may be useful at this point to form a clear idea of the different ways in which they conceived of the sphere of supreme realities. In both systems the supreme reality is described as a triad; but Vedāntism (in that form which we are considering here, which is also called Advaitism or spirit-monism) conceives of the triad as a substantial unity in which each of the three constituents, one of which is *cit* or spirit, is an aspect of the unity and in reality totally identical with it—in fact the Supreme Reality itself, comprising all the three aspects, can sometimes be called "the One" (εκα). Neoplatonism's triad, on the other hand, is subordinate, with *noûs* being subordinate to the One, and Soul to *noûs*.

The Indian triad, however, is similar to one of Proclus's triads (see W. Beierwaltes, *Proklos* (Frankfurt am Main: 1965) p. 93 ff.). Proclus has οὐσία, ζοή, νοῦς (being, life, spirit; cf. Proclus, *Stoich.*, prop. 103); Vedāntism has "being," "spirit," and "bliss" (*sat-cit-ānanda*). In this compound *cit* (spirit) occurs as the second member. In the Greek triad which I just quoted there is not so much subordination as interpenetration. "Every element of this triad is all the three, but the three are in each element as themselves and at the same time after the manner of that in which they inhere" (Beierwaltes, op. cit., p. 95). The One as such is absent in this triad, which in its essence is an explication of the nature of the hypostasis *noûs* (Beierwaltes, op. cit., p. 97), which as such, of course, remains subordinate to the One.

One of the consequences of the subordinative structure of the hypostases in Neoplatonism is the different treatment of the problem of freedom of the Absolute in the Greek system as compared with the Indian. In Vedāntism, freedom is represented as being inseparably linked up with the spiritual nature of the Absolute. The Absolute is shown to be free in two senses: in the sense of being independent of other entities (*svatantra*) and in the sense of not existing for another's sake (*svārtha*). While the notion of independence needs no elaboration in Vedāntism<sup>5</sup> which holds the Universal Spirit to be the Absolute, the concept of *svārtha* is thoroughly discussed (Śaṅkara's *Upadeśasāhasrī*, Gadyaprabandha, Chapter 2). Neoplatonism ascribes freedom in every sense to the One. Plotinus, at the end of a long treatise "On free will and the One's will," states that the One alone is really free (μόνον τοῦτο ἀληθεία ἐλεύθερον, *Enn.* VI.8.21.31). This seems to be consistent with the structure of the Neoplatonic system, which teaches two supreme realities, in succession subordinate to the One, which is *the* Absolute.

Yet, you may pardon me, I find it hard to reconcile with my Christian and Indian way of thinking to conceive of a Supreme that is free without being of the nature of spirit—this *via negationis* could perhaps become meaningful only if

complemented by a *via eminentiae* and by the thought-pattern of the analogy of being. And I find it questionable that there should be a subordinate hypostasis which is spiritual in an absolute sense, i.e., to the extent of being self-effulgent, but which is lacking in absolute freedom. In an earlier study, I tried to show even within the domain of Hindu philosophy that it is an incomplete stage of insight if the inseparability of spirit and freedom has not been perceived.

A feature strikingly common to the Neoplatonic and the Advaitic idea of spirit is that both normally conceive of spirit as universal. This seems to be more or less inevitable, considering the similarity of starting points of the two systems and, especially, the still greater similarity of their respective goals. But I cannot enter here into this phenomenon; it would amount to something like metaphilosophy or theology. The individual existence of spirit is of course also envisaged in both systems. The thought pattern by which Neoplatonism tries to solve the problem of the relationship between the universal and the individual spirit may perhaps, briefly and with some simplification, be described as existence of the higher in the lower, of the universal in the individual. In India, the various schools of Vedāntism have proposed different solutions. The system which I am considering, Advaitic Vedāntism, solves the problem in a way totally different from Neoplatonism.

We have reached here a point where the two systems radically diverge. The relationship between the universal spirit and the individual, the role of spirit in cosmogony or cosmology, and man's road to union with the Absolute: these are problems whose treatment bears only very few similarities in the two systems; nay, the characteristic disparity of the two cultures becomes strikingly manifest here.

I need not enlarge on the relationship between Spirit and Soul, first, because my audience is better informed of this subject than myself and I have no insights to contribute to the knowledge of Neoplatonism; secondly, because there is absolutely no analogy in Vedāntic thought to the relevant

Greek doctrine. Simply in order not to leave the doctrine in question quite unmentioned and to provide a contrast to set off the Indian doctrines which I am going to delineate, I will quote Proclus's brief proposition from the *Stoicheiōsis* (193): "Every soul takes its proximate origin from spirit" (πᾶσα ψυκὴ προεκεῖνος ἀπὸ νοῦ ὑπεστέκεν), and Plotinus's brief remark that soul is the spirit's outgoing activity (ἐνέργεια ἔχ. αὐτοῦ; *Enn.* VI.2.22.26; cf. V.1.2.5, οἷον λόγος ὃ ἐν προφορᾷ). In Vedāntism, there is no differentiation between Spirit and Soul. Both words are indeed used in translations and English-written expositions, with spirit, however, occurring comparatively seldom. But the meaning of the words in such translations of course always depends on the Indian original they stand for. In speaking of Vedāntism, please note, I leave out of account other Indian philosophical systems—"soul" is often used as a translation of Sanskrit *ātman*, but this word is also, and mostly, rendered by "the self." I prefer this translation,<sup>6</sup> first, because it is strictly literal since *ātman* also performs the function of the reflexive pronoun in Sanskrit; secondly, because the word is excellently suited to express the essential in man, that without which man is not man; thirdly, because it is devoid of any preconceived content; fourthly, because in metaphysics the expression "The Supreme Self" easily offers itself as a term to denote the Personal Absolute by analogy.

The self or *ātman* is, as I hinted before, a triune entity, in the monistic system mostly understood to be the Absolute. Its constituents or aspects or characteristics, each of which is the whole, are Existence, Spirit, and Bliss (*sat-cit-ānanda*). I venture to submit that the similarity between this triad and the Christian Trinity on the one hand as well as Proclus's "Being-Life-Spirit" triad on the other hand is no mere chance but is grounded in reality, the more so since this triad of Proclus does not so much imply subordination as interpenetration. The greatest divergence which separates the three triads is, I think, not the fact that they do not totally coincide at the conceptual level but that the idea of three *Persons* with

an identical substance is unknown to the Indian and rejected by the Hellenic philosophers.

The prominent characteristic of the Self is doubtless Spirit. Śaṅkara, the most renowned teacher of the Advaita-Vedāntist school, treats of the Self almost exclusively as Spirit. The actionless activity, or rather the nature, of the Spirit is described by two metaphors: it "sees" and it "shines" or "illuminates" (see Śaṅkara's *Upadeśasāhasrī*, Gadyaprabandha, Chapter 2). What does it illuminate? First of all, it is important to note that, like the sun, it shines even if there is no object to be illuminated (this is what Deussen called a "monstrosity," as I have noted before). Shining and seeing is its nature and not an adventitious event. When there is an object of its illumination, this object is neither the outward world of things nor an "intelligible universe," a *κόσμος νοητός*. Vedāntist psychology, in this point similar to that of the Sāṅkhya system, posits a psychic entity which I prefer to call "Inner Sense" (others call it "Inner Organ"). It consists of subtle, imperceptible matter. Through the mediation of the senses, it receives impressions—in the literal sense of imprints—from what the Neoplatonists call "the Sensible World," *κόσμος αἰσθητός*; besides this Inner Sense is also the agent or subject or substratum of thinking, and in perception as well as in thinking it takes the form of fluctuations or modifications of the subtle matter that makes up its substance.<sup>7</sup>

According to Advaitic Vedāntism, even these processes are raised to the level of consciousness only by the Spirit's "seeing" and "illuminating" them. There is no trace of a borderline, like the one which Neoplatonism draws, between the "sensible" and the "intelligible" world, and the Vedāntist's estimation of the sensible world and of pure thought is almost the reverse of the value-system of all Platonism. Pure thought is always suspect of being mere fancy.

But I said, "almost" the reverse, because Vedāntism, far from being a pedestrian matter-of-fact philosophy, has developed such a pure and sublime concept of Spirit as no other philosophy, be it in India or in the West, has ever succeeded

in discovering. I think it was an enormous achievement to abstract Spirit not only from its contents but also from those elements that seem inseparably linked up with it to form the Ego or the Subject of Knowledge. I may note here in passing that what Platonism intends to express by the conception of the "intelligible world," emerges in Vedāntism also, but at quite a different level. For the time being, I think it in place to try to explain how Advaitic Vedāntism, with its higher evaluation of direct perception (which it shares with all Indian systems of thought), could nevertheless attribute such an elevated rank to Spirit.

The argumentation which establishes this rank presupposes a highly developed awareness of the subject-object relationship. Its starting point is the axiom that the knowledge of a thing is dependent on the object, i.e., on the object being there, not on any activity of the knower. This statement is directed against the view predominant among earlier Vedāntists who sought to attain to union with the Absolute or the Supreme by different kinds of activity, namely by strict morality, asceticism and meditation (which is a mental action). Śaṅkara appreciated all these activities without restraint, but he denied that they could bring about realization of the Absolute. He contended that this goal implied, or consisted in, *knowledge* of the Supreme; knowledge, however, can never be reached by any activity, mental or bodily. The thing sought to be known must become manifest: this is the only practicable method, or rather, there is no method, but knowledge must emerge of itself. Now the Absolute, in this context called Brahman, is certainly not an object like a thing or even an idea or a complex of ideas. Rather, it is the knower's own self.

Here the spirit-monism of the system comes up. A man's self, whose nature is pure spirit, is of course better known to him than any object, though this knowledge has not the form of a subject-object relationship. Consequently the Absolute is in reality that which is best known to everyone, because it is identical with everyone's own self.

But why are people not actually aware of it? Here the illusionism of Advaitic Vedāntism is introduced. If the Brahman is, as the system teaches, identical with each man's self, without man's being conscious of it, this is the effect of Nescience (*avidyā*), the Vedāntist replies.

Nescience or ignorance is a notion that occurs in all systems of Hinduism, Buddhism, and Jainism. All these systems intend to show to man the road to everlasting release—release from the body, with a positive content differently conceived of in the several systems, and the road to release consists in, or includes, right knowledge. To some extent, the notion is known to Hellenic philosophy also. Even Plotinus can occasionally mention ignorance (*ἀγνοεῖν, ἀγνοία*; *Enn.* V.1.1) as one (not the only) cause entering this world.<sup>8</sup> Advaitic Vedāntism, however, has, in the course of many centuries, bestowed a tremendous amount of ingenuity on constructing arguments and theories to demonstrate what nescience is.

As regards Vedāntism I do not hesitate to state that in my opinion in all the huge literature on nescience and *māyā* (the Power of Illusion, more or less identical with nescience) I find, if not absolutely nothing, at any rate very little that is of philosophical relevance. I will not expatiate on this subject but mention only so much as seems to be indispensable for explaining the Vedāntist concept of spirit. The doctrine of nescience and *māyā*, as well as the monism of the system, seem to have been the price the Vedāntists had to pay in order to elaborate their doctrine of pure Spirit. I may note in passing that this price need not be paid, and the truth of the Vedāntist concept of Spirit, if differentiated into individual Spirit and Supreme Spirit or God, can very well be upheld if, instead of monism and illusionism, the thought pattern of the analogy of being is made use of. But I cannot enlarge on this theme here. I may only note that this is, of course, another concept of analogy than that which occurs in Proclus and is referred to by Professor Beierwaltes in his book on *Proklos* (pp. 73 ff.). I have now to treat of the doctrine of monism in so far as it is necessary to understand the Vedāntist concept

of spirit, and of the theory of nescience or *māyā* in so far as it is ancillary to that concept.

To begin with monism, it is largely based on tradition though there were very different kinds of monism in the course of time. The system I am treating advocates radical spirit-monism. The only rational proof the great Śaṅkara has given for this theory includes a fallacy. Since in all acts of consciousness, no matter at what time, in what place, and in what person they occur, the quality or *essence* of consciousness is the same, Śaṅkara concludes that all acts of consciousness are also identical in *existence* (see his *Upadeśasāhasrī*, Gadyaprabandha, Chapter 2). By the way, here we see the value of the medieval distinction between “to be (there)” and “to be thus,” or between existence and essence.

As regards nescience or *māyā* (we may skip here the differences established by some thinkers between the two words), it is, according to a later, but very common explanation (so that quotations are unnecessary) an inexplicable entity whose status of being can be described neither as existent nor as non-existent. So far, I am ready to concede a certain philosophical relevance to the doctrine, for, from the metaphysical point of view, it is meaningful to distinguish degrees of reality. But later Vedāntism (Śaṅkara had not yet foreseen all consequences to which the ideas of his system tended) explained the whole world, all matter, manifoldness, time, space and even all psychic events, as products of *māyā*, which was described as their material cause and as being, like their cause, neither existent nor non-existent. *Māyā* has two powers, one veiling and one dispersing. It veils the nature of the Universal Spirit, and it creates the illusion of a manifold world in space and time, material and psychic. This is how Vedāntism tries to solve the problem of individualization: it is simply an effect of *māyā*.

Most remarkable in our context is the fact that even the Supreme God—called *īśvara*, “the Lord”, for India has developed different forms of quasi-monotheism, coexisting at a higher level with the traditional polytheism and in individual

cases ousting it more or less—even the Supreme God is associated with *māyā*: only in combination with this Power of Illusion is God the creator, preserver, and destroyer of the world. I mention this chiefly for one reason. For here we find a striking analogy to the “intelligible world” of Platonic ideas. *Māyā* is also called *Potency* (*śakti*, St. Thomas’s active *potentia*)<sup>9</sup> and this makes creation possible. And, what is most astonishing, before creation all things exist as objects of the Highest God’s contemplation, i.e., his *ideas* (see Śaṅkara, *Brahmasūtrabhāṣya* 1.1.5). Surely God is by nature Spirit, even in his association with *māyā*, but this association makes an equation with pre-Christian or Christian Neoplatonic ideas impossible or at least requires adjustment. Nevertheless, there is a striking similarity in so far as the Vedāntist teaches that things preexist as God’s ideas.

A similar association with *māyā* (in this context preferably called nescience) occurs in the individual. The most refined product of nescience is the Inner Sense (designated by *buddhi*, *citta*, and other words). Now the close association of Spirit (*cit*) and Inner Sense (*buddhi*) makes up what may be called the Ego (*ahamkar* in Śaṅkara’s terminology) or the Subject of Knowledge. Release presupposes the extremely difficult mental severance of the spirit from its associate, i.e., the very Ego has to be as it were, dissected. Only then, the system teaches, can pure Spirit shine forth.

I must now come to a conclusion. In spite of the enormous disparity of the two cultures we found in the two systems an impressive number of terms that are partly almost literally translatable, partly interpretable as different ways of pointing to the same intended reality. Historical influences from either side are quite improbable.

In two cases we found remarkable doctrines each of which is fully elaborated and cleansed from unnecessary associations in one of the two systems only. The first of these doctrines is the Platonic concept of Idea, which Neoplatonism has incorporated into *noûs*, thus preparing the way for classical Christian cosmology. If theistic metaphysics is to survive, if the

doctrine of God is not to degenerate into an ideology ancillary to anthropology, it is indispensable that we should uphold this heritage of Platonism and Neoplatonism. In monistic Vedāntism, monism, with its corollary, illusionism, made it indeed hard to explain the origin of the perishable world from the Absolute; all the more notable is the fact that even in this system there emerges an adumbration of Platonic Ideas.

As regards the doctrine of Pure Spirit in Vedāntism, it is certainly one of the greatest achievements of philosophy. It is not logically necessary to associate it with monism and illusionism. Śaṅkara himself has shown this, in demonstrating, in a passage of his great commentary on the *Brahādāraṇyako-paṇisad* (4.3.7),<sup>10</sup> how Pure Spirit is the principle of unity that makes not only all mental and sensory acts possible, but whose light binds even vegetative processes, together with the consciousness-events, into the psycho-physical unity that is man. Śaṅkara seems here—whether deliberately or not, we cannot know—to have kept in suspense his monism and illusionism. It is deplorable that this fragment of a great spirit-oriented anthropology was never elaborated. Nevertheless, it could help us, just with its irrefutable concept of pure spirit, to defy that materialism which nowadays has almost everywhere discarded the traditional notion of soul.

In these two, and probably even in more respects, the study of Vedāntism and Neoplatonism, and even more the comparison of the two systems (as well as the comparison of classical Indian with classical Western systems of philosophy) seems to be of great relevance to our time, provided we recognize the value of great tradition in general and metaphysics in particular.

#### NOTES

1. Armstrong, in his book *The Architecture of the Intelligible Universe* (Cambridge, 1940), p. 49 f., lists no less than six “aspects” of *noûs*.

2. But cf. also Aristotle, *de Anima*, 430a3.
3. Cf. also *Liber de causis*, prop. 15, with St. Thomas' comm. lect. 15.
4. ὁ δ' ἐκεῖνο τὸ φῶς τῶν ἀληθῶν λαβὼν ὅσον βλέπει μᾶλλον τὰ ὁρατά. . . Ἡ δὲ ἐν τῷ νῷ ζωὴ καὶ ἐνέργεια, τὸ πρῶτον φῶς ἑαυτῷ λάμπων πρῶτως καὶ πρὸς αὐτὸ λαμπηδῶν, λαμπὸν ὁμοῦ καὶ λαμπόμενον, τὸ ἀληθῶς νοητόν, καὶ νοοῦν καὶ νοούμενον, καὶ ἑαυτῷ ὁρῶμενον καὶ οὐ δεόμενον ἄλλου, ἵνα ἴδῃ, αὐτῷ αὐταρκες πρὸς τὸ ἰδεῖν· καὶ γὰρ ὃ ὁρᾷ αὐτό ἐστι· γινωσκόμενον καὶ παρ' ἡμῶν αὐτῷ ἐκείνῳ, ὥς καὶ παρ' ἡμῶν τὴν γνῶσιν αὐτοῦ δι' αὐτοῦ γίνεσθαι. [*Enn.* V.3.8.34-44]
5. Śaṅkara, in his *Brahmasūtrabhāṣya*, in most of the occurrences of *svatantra*, denies that anything but Spirit can be independent; a passage where *svatantra* is directly and positively connected with *ātman* (which is spirit), is to be found, e.g., at *Brahmasūtrabhāṣya* 2.3.36, in the end.
6. The concept of "real self" is not foreign to Neoplatonism; cf. W. Beierwaltes and H. U. V. Balthasar, *Grundfragen der Mystik* (Einsiedeln, 1974), p. 13, n. 2.
7. Here the νοοῦν and the νοούμενον are identical, in spite of Aristotle (*de Anima*, 430a3), though the objects can be material and the Inner Sense in any case consists of (subtle) matter.
8. Proclus teaches that the philosopher's ascent to the One includes cleansing from ignorance; cf. Beierwaltes, *Proklos*, p. 285. What has been constructed in Advaitic Vedāntism is a frightful fortification to defend the central mystery of spirit-monism, namely, the doctrine that the world is an illusion, neither being nor nonbeing. This idea looms up, occasionally and in quite a rudimentary form, in Plotinus also: he can call matter, though in an *optativus potentialis* and in a certain respect only, "nonbeing," μὲ ὄν (*Enn.*, II.5.4.11).
9. *Dynamis* in an active sense occurs in Plotinus, *Enn.*, III.8.10.1.
10. Cf. my paper "A Note on Śaṅkara's Conception of Man," published in *German Scholars on India, Contributions to Indian Studies*, ed. the Cultural Department of the Embassy of the Federal Republic of Germany, New Delhi, Vol. I (Varanasi: The Chowkhamba Sanskrit Series Office, 1973), pp. 99 ff., and my articles (in German and Italian) mentioned in the footnotes of the above-mentioned paper.

## Matter in Plotinus and Śaṅkara

Francisco García Bazán

University of Salvador  
Buenos Aires, Argentina

In the first two parts of this tripartite essay we shall deal with the notion of matter in the works of Plotinus and Śaṅkara respectively. The third part considers the parallels and analogies which may be established between them.

### I. Plotinus<sup>1</sup>

#### *The Plotinian Notion of Matter*

The notion of matter is considered in *Enneads* II.4.12. It is not surprising that the notion of matter is treated as a singular notion, even though the formal object of investigation is revealed as having two distinct natures. In the beginning of the treatise, as in many other places in the *Enneads*, matter is characterized as "substratum" or "receptacle." Matter in the spiritual and sensible world fulfils the same function, namely

Translated from the Spanish by Woodrow W. Moore, Department of Foreign Languages and Literature, Old Dominion University, Norfolk, Virginia.

as the receptacle of forms, thus permitting the generation of beings. In the Platonic tradition, Plotinus maintains that matter must be present both in the realm of spirit and in the sensible world.

Plotinus investigates the question of what is underlying, how does it receive in itself that which is alien to it, as well as the quality of that which it receives both in spiritual and sensible compounds. Thus Plotinus examines two notions of matter—the spiritual (chaps. 3-5, fundamentally) and the sensible (chaps. 6-16).

In the examination of spiritual matter three aspects are raised: first, the possibility of the existence of spiritual matter; second, its definition; and third, its mode of existence. Spiritual matter is 'indefinite' and 'lacks form'. Spiritual beings have a composite character, just as corporeal compounds. The contrast is that spiritual beings are non-spatial and non-temporal as well as unchangeable, while corporeal ones are spatial, temporal and mutable. Thus spiritual matter always possesses and complements the same form, has form eternally, and is eternally defined.<sup>2</sup>

Spiritual beings, or ideas, exist and are multiple. Each one has form which particularizes it, and each has something in common, a substratum. Thus is the diversity and unity of Spirit accounted for. Spirit is one, in the sense of the receptacle, but multiple in the totality of its beings.

What, then, is spiritual matter? It is the capacity of reception of spiritual characteristics. And what is Spirit as form or informer? The determination, the characterizing force. At their confluence the potencies of donation and reception constitute Spirit. The donating potency defines, while the receiver allows itself to be defined: thus the first has the capacity of multiplication, the second permits the act of multiplication. Spirit is a multiple unity. As a pure aspiration to existence, knowledge and beauty it has allowed the birth of beings, real and beautiful.

The tangible universe, plentiful in its concrete multiplicity, is an image of the spiritual universe. Thus distinction and

multiplicity must also be present in the spiritual domain, and so the manner of division must transcend space and time. In the spiritual also there must be as residue the amorphous or undefined upon which distinction is based.<sup>3</sup>

The fact that spiritual matter has the forms eternally and fully does not preclude the spirit from being a compound. Just as sensible bodies always reveal themselves to the intellect as informed, having an informing principle and a matter which is informed, so spiritual being also has a depth (*bathos*), like a darkness, upon which the light from *logos* is projected.<sup>4</sup> It would be wrong to believe in the simplicity of spiritual beings just because in them form and matter are always united, for after all, the same holds true for sensible bodies. In the former the unity may be more perfect since it is eternal it is nonetheless a dual unity.

When spiritual matter is informed, it is a total or true life; when the same occurs with sensible matter, "information" is identical, but the resultant is like an "adorned cadaver," a reflection of spiritual life. Spiritual matter is truly a substance, because in the realm of Spirit, since everything truly exists, everything underlying the spiritual compounds is also illuminated reality.

The origin of spiritual matter can only be examined in light of the awareness of the eternal nature of Spirit. Spiritual matter must be engendered, because it has a principle: the One; but it must also be unengendered because it is beyond time and always exists. Why is the Spiritual realm both dependent and eternal? The fifth chapter provides the most acute answer. The Spirit, in order to exist as Spirit must reveal in itself a presence of a contrast to the limpidity of The One. If the Spirit exists it must proceed from the One but is a composite of form and matter in contrast to the simplicity of the One.

Matter is also related to Otherness. What must have preceded perfect spiritual existence for it to exist as it does? Something other than the One, which while wishing to be other than It, also wishes to be like It. Otherness, then, is

epinoetically movement, having the character of the undefined (seeking determination by the One). In that sense Otherness is the character of spiritual matter. Both Otherness and spiritual matter as such can be thought of (no doubt abstractly) as "evil," since, as undetermined, they have not yet attained their part of the Good.

Matter also has been associated with 'audacity', the centrifugal coexistent with the aspiration for determination. In this way it makes sense to speak of Otherness as the principle which makes the existence of matter possible, giving rise to the composite.

Thus, matter as substratum is not more than undefined and ambivalent aspiration, the other than the Good, which necessarily occurs in beings as defined, shaped and illuminated.<sup>6</sup>

Plotinus has taken the supreme categories of the *Sophist* and paraphrased them, showing the component elements of Spirit, thanks to which the sensible world will account for its image.<sup>7</sup>

We then proceed to the examination of the nature of sensible matter presented as the receptacle or substratum of bodies. In chapters 6 to 15 Plotinus distinguishes his own views from those of others (matter as mass, quality, quantity, mere logical negation, etc.), which, he claims, confuse the true material nature.<sup>8</sup> In the last chapter he examines in detail what sensible matter is, namely that part of otherness which opposes the forming principles, the *logoi*. It has its own reality which is not annihilated by the *logoi* coming upon it, but which permits their actualization, thereby revealing itself with greater clarity as matter—just as a woman makes her femininity more obvious by pregnancy, or earth displaying its fecundity after being seeded.

Accordingly, matter is analysed as "otherness," always in need, properly what is evil, ugly, weak and false.

Plotinus's later views on matter will be further discussed,<sup>9</sup> but these views, completed in 260-261 A.D., constitute the basis of his thought.<sup>10</sup>

Later he ratifies, and occasionally strengthens his analysis.<sup>11</sup>

Matter, clearly, fulfils its fundamental function of component and correlation necessary to the second and third hypostases.

The clearest synthesis of Plotinian thought we have is the "Great Tetralogy" (*Enneads* III.8.30, V.8.31, V.8.32, belligerently ratified in the fourth, II.9.33, the famous "Against Gnostics"). The main aim of the first of these, "Concerning Contemplation," is to show how the third hypostasis is generated. What is of specific relevance here is the description of the ontological condition of the sensible world, and its production. It is the consequence of contemplation by the Spirit resulting in wisdom pervading even the humblest corners of the cosmos.

From *Ennead* III.8.11 we learn (a) that the Spirit is vision, and therefore, a realized potency, and as such, composite; (b) the determinative aspect of the Spirit is a reflection of the One; but, though the One needs nothing the Spirit is in need, because it contains an otherness from the One, making it different;<sup>12</sup> and (c) in spite of the presence of matter in Spirit, and, in a way, because of it, Spirit desires the One and moves toward It. But this desire is adequately fulfilled, leading to the eternal harmony of form and matter in Spirit. In Spirit there is neither change nor search for new forms. It has all of them, and its aspiration is firm and constant for the truly real, and hence also beautiful.

This is explored in *Ennead* V.8 in which beauty is shown to be none other than the perfect adequacy between form and matter. Thus Beauty itself is rooted in Spirit,<sup>13</sup> and therefore one can develop a hierarchy of beauty from artistic or artificial, to sensible or natural, to inner or psychic beauty, finally to Spiritual beauty, or beauty itself.<sup>14</sup>

An analysis of the relationship between spiritual and sensible beauty follows. After the discussion of Spirit as Being and Beauty Plotinus examines Spirit as truth and knowledge. The perfect unity of the knowledge and the known is achieved in Spirit which always possesses it as its own self-contemplative reality. It is this knowledge which defines it. Here again the

familiar motif of the matter and form of Spirit, this time in its gnoseological aspect is described—as what knows and what is known.

After that follow ontological, aesthetic and gnoseological analyses of how the sensible cosmos is related to its Spiritual model, Being, Beauty and Truth. These, then, are shown to depend on what transcends Being (as well as non-being), which makes Spirit possible, and which reigns over Spirit.<sup>15</sup>

In several passages of *Enneads* II.9 Plotinus rejects Gnostic theories of matter.<sup>16</sup> In the Plotinian view sensible matter is not substantial, nor independent, nor responsible for a universe alien to the Spirit. Matter is also presented as the origin of human wickedness, the “other” to being and form. Inasmuch as evil does not occur in the hypostases, it is sensible matter only which is so charged, functioning in the world of change, in an ethical plane, affecting the behaviour of man.<sup>17</sup> The condition of human wickedness is exactly its own constitution, in which the evil inheres in the sensible matter. Hence the call to purification, using the language of “escape from the body.”<sup>18</sup>

It is thus demonstrable that every ascending wish as well as all descending biases have their origin and explanation in matter, which is an aspect of every composition. But as to the origin of matter, a mystery remains: matter is simply a datum drawn from experience, refusing every rational questioning concerning its own provenance.

#### *The Ontological Image and the Theory of Causality According to Plotinus*

In *Enneads* III.6 Plotinus addresses the apathy of matter, revealing his profound comprehension of it. Two ideas stand out, which will facilitate the comparison with Śaṅkara:

(1) Matter as receptacle or substratum, making possible the concept of image; and

(2) The nature of the intimate constitution of the image-participation.

While in this text, because of its relation to the soul, the emphasis is placed on the sensible world, but as that is a copy of the spiritual, what is said of it will apply analogically to the latter.

The material receptacle reflects what is presented to it as does the surface of a mirror. That is, without undergoing any change of its own constitution it generates, or permits the birth of reflection. In this way it is the necessary ingredient of each being. Without matter the One will maintain itself eternally in its silent non-Being; hence even that which is without foundation, the *IT-SELF* by its own ineffable intrinsic potency is reflected, and the reflection, the weakening of the potency is inconceivable without that ground which permits reflection. There are, then, in Plotinus, two clear, antithetical concepts of potency: one out of excess, and the other, out of defect. It is the conjugated unity of both, and the distinction, which allows their being grasped as the conjuncture of three hypostases and of the world. It is the conception of mixed beings which stimulated the precise and daring expressions used by Plotinus in such places as *Enneads* III.6.7.21-43.<sup>19</sup> The metaphysical reality of sensible beings is that they are images, reflections, figures outlined on a medium always firm in its fallacious nature, and which, for that reason, can create the illusion that the reflection is the reflected object. Actually it is but a deceit: the image is not the truth, the truth is the model that is reflected. Therefore, strictly speaking, the sensible being is not authentic reality, but reality is the determining factor of its projection. We may keep on with an identical reasoning, and apply our logical attention no longer to the sensible world, but to the spiritual universe. We shall prove that the latter encounters in itself the same relation of image with respect to the first hypostasis since it deals with the first circumscription, reflection, or

irradiation. From this new perspective, the One, the ultimately unfounded, is beyond the being, the knowledge and the beauty, or if one wishes to say, non-Being, non-Knowledge and non-Beauty, because it is the inexhaustible Principle, the authentic Reality. Thus the Spirit in relation to It, happens to be as unreal—because of its imaginary nature—as the sensible universe is with respect to the *κόσμος νοητικός* (*kosmos noetikos*). This explains how Plotinus, when referring to the last aspect of his concept, could have written such phrases as: “it must be unique,” “it is Alone,” “to become to be Alone,” “The One is all and it is nothing,” etc.<sup>20</sup>

But, out of logical necessity, the receptacle, the weak component of the image, moves towards the ultimate meaning of the compound constitution. The compound is an image; consequently, from its ontological perspective, the compound hurls itself towards the cause of its existence, which is simpler. The ontological image is nothing but the mere undulation on the water surface, the image in the mirror, in water or in the shadow, as the Master himself says. Then, what is the image? Mere reflection. In what consists its entitative actuality? Simply in reflecting something that is assumed stable and original. Consequently, even with greater profundity, the entitative actuality of the image consists in its participating nature in the model; that improper and ephemeral quality that has given it the power to reflect. Then we see that the image as a conjugation of possibilities is properly image and likeness; image, because of what it appears to be, and likeness because of what permits it to have the appearance of the latter, or that being. Image, then, is a luminous reflection, which nostalgically recalls as its resemblance, its original.<sup>21</sup> Who can doubt, then, that “only likeness can know likeness,”<sup>22</sup> that matter does not have to be locally separated from form, and that other assertion—which is a paradox—that Soul never completely sinks in matter?<sup>23</sup>

The Plotinian theory of participation is another described aspect of the ontological theory of the image. And the two conceptions shed light on the other important point of our

writing, its peculiar theory of causality. These together show us the brilliant manner in which Plotinus was capable of solving the old philosophical problem of the coexistence of the One and of the multiple.

The following quotation from Plotinus supports the interpretation of *Enneads* III.6.7 and permits us to understand with greater clarity the structure of the ontological image and the elements it presumes: “The painted portrait is not precisely the production of the reflection and the image, as happens with waters, mirrors and shadows” (*Enneads* VI.4.10.11-13).<sup>24</sup>

Any one of the examples cited is sufficiently illustrative in itself to illuminate the constitution of the image and to reveal also that its relation to the model is something necessary and intrinsic to the nature of the image. But because of a new reflection on the structure of the ontological image, it is possible to discover also that upon this conception rides the Plotinian theory of causality. The model/image duality is the concise synthesis of his deepest comprehension arising from the experience of the mystic, as the more refined way to apprehend reality.<sup>25</sup>

The model, as it can be considered, is the case of a man and his specular image. He engenders or originates the reflection, but in no way is it proper to say that the image in the mirror forms part of the subject. He produces the image and because of him, it has an existence and reality, but he is not reflection; not contained in it. Using other vocabulary, the cause produces the effect. However, the effect, insofar as the cause is a totally different reality, is not in the cause. The cause produces the effect, but in reality the effect does not exist, autonomously; what truly exists is that on which it depends, the cause. What most truly exists is the uncaused Cause. This has been stated by Plotinus on many occasions:

That which is spiritualized (*τὸ νοερόν*) remains in itself and does not have need of anything. . . .  
[*Enneads* V.4[7]2.14-15]

Because being the nature of the One is the generatrix of all things, it is none of these. [*Enneads* VI.9[8] 3.39-40]

The One is not in its products, because it is prior to them. [*Enneads* 5.36-37]

Consequently, what is Cause of all things is nothing from amongst them. [*Enneads* 6.55]

Because the One is none of these things since everything comes from It, because It is not contained in any form; yes, the One is alone. [*Enneads* V.1[10] 7.20-21]

Or, if one wishes, in general:

The One is all and is nothing, for as the Principle of all things, it is not all, but it is because, so to speak, all returns there; better still, they are not, but they shall be. . . . What is engendered [=the Spirit] turns toward IT. . . . And what the Spirit produces is its image . . . the Soul, which engenders an image of itself. . . . [*Enneads* V.2[11] 1 ff.]

In this manner we form a notion of procession as a vital line made up of a discrete projection of points each of which is the image of the preceding, yet different from it. The original, the One, for that reason, is all, and yet none of the rest. These latter, the effects, are thus produced by the cause, but are in contrast with its reality, are relatively unreal. It is this mystical consciousness of the degrees of reality that constitutes the idea of procession from higher to lower planes of being. In the ascent back there is the vital experience of rupture among the diverse levels. Return to the eternally real is not a metaphor. It is to return to the original from the image, to what truly is and never ceases to be. In contrast with the sensible, the One is the No-thingness, the alien whose

stable or ephemeral appearances occur—thanks to matter—in the reflections of Spirit and the world; it is the mystery of the image; the One of essential causality; the One of the participation in the dream of No-thingness that is our lot to live.

## II. Śamkara

### *The Śamkarian Notion of Matter*

We will deal now with the master, Śamkara, the Indian philosopher of the eighth century, who ranks with Rāmānuja as the best qualified interpreter of the Vedānta.<sup>26</sup> He is an exegete of the Vedānta or the *darshana* which places special emphasis on the reflection concerning the ultimate meaning of reality or the Brahman. He is a thinker who, as a philosopher, belongs to the highest order, that of a metaphysician. He renders his doctrine in the form of a commentary on the traditional and sacred texts of Hinduism. Thus, his most outstanding works, and also the most extensive, are the interpretations he has written of ten *Upaniṣads*, the *Commentary to the Bhagavadgītā* and, above all, the *Commentary to* [Bādarāyaṇa's] *Brahma-Sūtra*. He opposed the interpretations of the followers of the Sāṅkhya, the Nyāya-Vaiśeṣika schools, and some Buddhist schools, pointing out that the aphorisms of Bādarāyaṇa not only synthesize the Vedānta doctrine, but, at the same time—under the Advaita form of non-duality—constitute the most appropriate manner of conceiving the traditional teaching of the *Vedas*.<sup>27</sup> Śamkara has also written a few minor works, but due to the fact that for the Indian author we lack chronological knowledge as definite as that which corresponds to Plotinus, and owing to the fact that not all the works attributed to him are his writing, we will consider the *Commentary to the Brahma-Sūtra* as the basis of our exposition.<sup>28</sup>

Śamkara does not have the same propensity as Plotinus for analysis and discursive exposition. By this, we do not mean to

say that Śaṅkara is not analytical in his expositions, since he examines numerous topics carefully and justifies them with formidable scriptural erudition. Śaṅkara is more of a commentator on the sacred texts than he is a philosopher lecturing before a class. Śaṅkara and Plotinus have a comparable understanding of reality and a similar speculative capacity. However the impulse of the mystical or ultimate experience exerts a greater influence on the expositions of Śaṅkara. Therefore we observe in Śaṅkara a prevalence of synthesis which proves detrimental to the analysis. Obviously the western interpreter misses in Śaṅkara these analytical developments that could be so useful to him for confirming his exegesis.<sup>29</sup>

What does the Advaita Vedānta (non-dualism) mean to Śaṅkara? It means the interpretation of the Brahman as that which transcends duality and its affirmation as the sole reality that rises unchangeable before all that exists, or is said to exist. Evidently, what has been expressed neither rejects analysis, nor is it proclaimed as a merely dogmatic formula. Quite the contrary, it is the result of a fundamental experience, and therefore, has the capacity of being accounted for.

The final part of a brief text by Śaṅkara, the *Pañcikāraṇam*, provides us with a good synthesis of its general perspective:

Now, A, the state of vigil must turn into U, the state of sleep; U turns into M, the state of deep sleep. Afterwards, M must fuse into OM, and OM into the Self. I am the Ātman, the inner witness, the Absolute, who has the nature of pure conscience. I am neither ignorance nor its effects. I am the only Brahman, eternal, pure, omniscient, eternally free and real. I am absolute happiness the One second to none and the inner Conscience. I am Brahman himself. Remaining in this state of absolute identification is what is called the perfect state of concentration.<sup>30</sup>

Here we find summed up what is provided us in the *Commentary to the Brahma-Sūtra* as to what the Śaṅkarian doctrine is in essence. At the pinnacle of all reality we find the supreme Brahman. This first and only reality is beyond every attribute and qualification; and this is so for the simple fact that it deals with the support of all and is that which nothing supports. It is what is devoid of foundation, and for that reason is the authentic foundation.<sup>31</sup> As one might say technically, it is "satcitānanda," that is to say, pure being, consciousness and happiness.<sup>32</sup> It is the synthesis of the transcendentals to which a corrector epithet is applied to make the unseen one observable, so that, in reality, we are at a point which is truly more than the simultaneous existence of the being of truth and beauty. We are above them.<sup>33</sup> And precisely in this case—the experience of reality—it is the language that betrays it, because the language, although it be in its most exact form—that produced through metaphysical speculation—has as the basis of its expression the enunciated. The latter is necessarily analytical in nature, and is enunciated on the basis of attribution, and all attribution that is assigned to what primarily rejects it is falsehood. False attribution, the *adhyāsa*, is the incorrect application of the attributes (and what greater mistake than applying them to what by essence rejects them!) and is the foundation of every mistake. Be on the alert then, with language, when what we want in reality is to shelter ourselves in Silence!<sup>34</sup> The latter here referred to is the plane of true knowledge, the point of view of *parāmarthika*.<sup>35</sup> The normal man is not at such heights, but rather, he loves, suffers, strives, knows a few things, ignores many other things, etc., and moreover, he firmly believes that all these acts and the objects that originate from them have the most solid reality. In the final analysis—man focuses on his existence not as a silence, but as a language, in the bosom of a multiplicity that subjugates him. For that reason, he adopts error as truth. He contemplates it not from a perspective of true knowledge, but from a *vyavahariki* viewpoint.<sup>36</sup> For

example, man will give full reality to the objects he experiments with and uses. He will take the cosmos as a unity in its true self. He will accept his internal order as another truth, and even with a religious sensibility, he will attribute to it a governor and creator in which he will discover the most sublime attributes. In all these cases, the common man and the believing man will be under the shadow of error and will be taking for reality what is not. Rather, they are merely its shadows, the diversity which the unique and undivided projects as the presence of *nāmarūpa*, names and forms.<sup>37</sup> But how can this be? Why, when the depth of man, when the *Ātman*, free of veils, re-encounters the Brahman, when the realization of the ONE-SELF is fulfilled and the sole truth that explains its fulfillment ("Thou art That"), the pure light shines, yet the subject moves from illusion to illusion?<sup>38</sup> Only the *māyā* is ultimately responsible for this situation. But *māyā* (a word that is repeated so much by Śaṅkara) is an elusive notion, many times thought to have been trapped, but which indeed, still escapes.<sup>39</sup>

There is in fact, a *māyā avyakta*, but also *māyā vyakta*; there is a *māyā* that is *ajñāna*, but also there is another that is the "divine power." There also are the powers assigned to it, the *vikṣepa-śakti* and the *āvṛti-śakti*, and the "mystery of *māyā*." How can one introduce a logical order in such a varied vocabulary?<sup>40</sup>

Let's see. Already in the beginning of the *Commentary to the Brahma-Sūtra*, the Brahman is introduced to us as the Principle, the Something from which the universe proceeds. The Brahman is the omnipotent and omniscient one from which all things come forth, and to which all things return. We find here the affirmation of a subordination between what is divine and what is worldly, as well as the acceptance of a difference and opposition between the Brahman and all the rest.<sup>41</sup> Consequently, two levels are presented to us. (1) The Brahman is the Principle, that is to say, he is as much the efficient cause as he is the material cause of all beings.<sup>42</sup> As a result, the Brahman does not produce the form in the way a

potter does, for he has to make use of a pre-existent material and apply his knowledge to it. Brahman generates spontaneously—just as a spider sends forth its web, just as light sends forth its splendor, just as fire sends forth sparks.<sup>43</sup> In brief, the Brahman radiates to all that is subordinated to him. Transcending Wisdom emits its rays everywhere. (2) The production of the Brahman recognizes two fundamental phases: the unmanifested state (*avyakta*) and the manifested (*vyakta*). The first stage is considered as the stage causing the second one, as its possibility.<sup>44</sup> In turn, the state of manifestation shows two aspects: the internal aspect of ordination and direction (*nāma*) and the external aspect of materialized and ordered realities (*rūpa*).<sup>45</sup>

In order to interpret Śaṅkara's cosmological levels in this manner we must emphasize that the Indian scholar understands the moments of inferior reality as simultaneous planes of ontological subordination, rather than as principles followed by a posterior evolutive development. What is not manifested is the principle of manifestation. As its productive power it repels and attracts, and in the universal dissolution, in the *pralāya*, that relation of inseparable and permanent subordination between the orders is shown.

Something similar occurs in the case of the concrete individual between deep sleep and his different states of oneiric sleep and vigilance. When the subject sleeps deeply, there is a possibility of the other two states. Deep sleep is the origin and source because of its own indifferenciation, not as germinal virtuality.<sup>46</sup>

Everything proceeds from the Brahman. What, then, is the product in respect to the producer? Well, its specification or determination, which manifests it in diverse degrees, although inadequately, at the same time that it manifests, hides it because it reveals it as what it is not. We find in language a correspondence to this same debilitated ontological reality, since judgement, the basis of all discourse, is in essence *adhyast*; it cannot be utilized without employing attribution,

consequently without attributing division to what is undivided.

The product is not reality, it is an illusion. Moreover, we are dealing with a type of illusion that supplants reality. Therefore, it is subordinate to it, but also opposed to it, and the only really metaphysical solution to this opposition shall be its separation, that is to say, seeing things as they really are, as appearances, and thus seeing the true reality hidden in it. We must pass from the product to producer.

There must be something that makes possible the concealment or the specification of the Brahman; undoubtedly, the *upādhi*, that is, the limiting elements.<sup>47</sup> Thus, the *Īśvara*, the *Brahman saguna* or *viśiṣṭā*, that is, the Brahman endowed with attributes or the qualified One, the cause of the universe, is no more than the Brahman with the *upādhi* of the *avyakṛta prakṛti*. The Brahman, limited by the non-manifested matter and the *virāt* or cosmos, is the manifested matter<sup>48</sup> but now with the *upādhi* of the *viakṛta prakṛti*. It happens in these cases just as it does with clay, with gold or with space. The jug made of clay, the adornment of gold, and the space within a pot, are but modifications in appearance of clay, gold or space, by virtue of the *upādhi* or the limiting characteristics of the clay or the adornment or the pot (although clay keeps on being clay, the gold, gold, and the space, space). These adopted shapes are a mere illusion that vanishes in its foundation, which is what permits the jug, the ornament and the pot to exist.<sup>49</sup> Each limited appearance of the Brahman is not the Brahman really. It is, therefore, *māyā*, that is, illusion, mirage. But this means that there must exist that which sustains the *upādhis* and permits the Brahman's limitations, something that must even possess a capacity for deceiving. Yes, that element is likewise *māyā*, but now not in regard to an illusory effect, but in regard to the source of illusion. This radically deceiving aspect is also called ignorance or lack of knowledge: *ajñāna*, *avidyā* or *māyā*.<sup>50</sup> If *māyā* exists as illusion, it is because the *māyā* also exists as a divine potency, and in the last instance, it exists as a possibility of deception. The last form of *māyā*

which is fundamental, has man as caught by the illusion (the mystery of the *māyā*). The illusion should be left to one side so the Brahman can be recovered, but man, if he is immersed in the illusion allows it to collaborate in his development by his not purifying himself from it, though it is not his ultimate source. Man is responsible for himself and his fellow man, and when he operates out of ignorance, he collaborates in affirming his enclosure, and projects his influence on the social cosmos. But he is not the creator of *māyā*. He, because, of his own anthropological structure, is already in the illusion, a product of a *ajñāna* which differs from the personal, which is not individual, but rather universal.<sup>51</sup> And, in fact, it is the ignorance in the cosmological scope that permits the *upādhi* which deceptively encloses the Brahman in *Īśvara*, as the lord of the creation, in *virāt*, as the cosmos created, and in the *jīva*, as the microcosmos that encloses the *ātman*.<sup>52</sup>

Therefore it is the *ajñāna* or the *mūl-avidyā* which, in the causal scope, gives a false image of the Brahman as *Īśvara* or *pradhāna* (the cause of the universe). It is the *ajñāna* that permits the birth of the manifested world of *nāmarūpa*.<sup>53</sup> It is said that the *ajñāna/māyā* non-manifested has a dual capacity: the power of projection, and the power of mental or intellectual confusion. That is to say, it is the *māyā* which permits the Brahman to appear as dispersed, multiplied, and so offers Brahman, under a nature not his own, but as a divided whole, which in reality, is not him. On the other hand, it is also the *ajñāna/māyā* that permits the illusion of the cosmos and the individual beings, but here the projecting and veiling capacity is seen in the extreme, since in the manifestation the multiplicity reaches its highest degree and the mental veiling has the cosmic possibility of engendering a type of illusion that attributes the true reality, not to multiple unity, but to simple and dispersed space-time unities, whose sum constitutes the world.<sup>54</sup>

The *ajñāna*, therefore, belongs to the same nature of the degrees of derivation of the Principle, but it is man, in so much as he is also a derived being, who manages to confuse

the moments of derivation with their source. That is why he overcomes the cosmic *māyā*—from which he is derived as a compound, his own *avidyā* or *tūl-avidyā*, and engenders, without ceasing, a false reflection of reality: the world which manifests its language, full and heavy with false predicates. Naturally, when the illumined subject recognizes his identity with the Brahman, he perceives what the true reality is, he goes from ignorance into knowledge, burns every residue of materiality (ethical, gnoseological, etc.), and from the correct point of view, sees each form and each particularity as an illusion: the rope that appeared to be a serpent shows its reality as a rope.<sup>55</sup> Does this last idea mean that once the mentioned “annihilation in the Brahman” has been brought about, the world disappears, and for that reason, the world is a pure negation? No. The nature of whatever opposes the Brahman—which is unreality with respect to the absolute reality is *anirvacanīya*, that is to say, indescribable, for it is neither real nor unreal. What does this mean? Well, let’s take into account the illustration of mother-of-pearl and silver. When one perceives, due to the scarcity of light, that a piece of mother-of-pearl is a piece of silver, and immediately when the light is increased, one has the assurance that the first was pure illusion, the illusion of the silver disappears and the mother-of-pearl appears as real. The possibility of deception always continues to be real, since it belongs to the same intrinsic constitution of what produces it, and is therefore distinguishable from the Brahman; but at the same time, it is something unreal, since the one who is informed has discovered that its true nature is not what it appears to be, but rather what is hidden behind it, the Brahman.<sup>56</sup> We can consider the concrete form used by Śaṅkara to refer to the degrees of reality and their unequal behavior.

*The World as Image According to Śaṅkara and His Theory of Causality*

According to Śaṅkara, how does one explain the presence of the Brahman in *Īśvara* and the world? Or to put it another

way—how does one explain the relation between *Unity* and multiplicity? By understanding the second as the image of the first, says the teacher, the Brahman is nothing more than a *pratibimba*. The reflection of the Brahman *nirguna*, and the particular entities in the same manner, are reflections of the Brahman. Beings are images like the sun that is reflected on the water, even though there be various ponds and the reflections are multiple, and even though the movement of the water obscures the brightness of the sun’s reflection, the sun is not for that reason more than one, nor does its brilliance lose potency. The weakness and the number of the images have nothing to do with Brahman, rather, the changes have to do with affections that are from the images, not from Brahman. We confirm that it is the *añāna* (matter) which as a reflecting medium permits the transformations, because it is also that which collaborates in the existence of the image.<sup>57</sup>

On the other hand, the equally numerous recourses to the clay limited by the shape of the pot or bowl, gold and adornment, space and spaces, sea and caves, may be interpreted in identical manner. It will not be a question of understanding the clay, water, etc., like unlimited mass or continent upon which are fictitiously placed worlds which limit them, creating in that manner, an internal division of the whole. These illustrations will be understood as suggesting that forms and distinctions are visible elements related to the most superficial layer of a more profound nature than the manifestation of those changes which remains unchangeable. The case of the waves and the sea is the most graphic and familiar example. In the same way our imagination can operate with the remaining comparisons.

This way of representing the relationship between the One and the multiple, with the necessary collaboration of matter or *añāna/māyā*, and illustrating their mutual behavior through the theory implied in the Śaṅkarian conception of the ontological reflection—does not contradict the idea of causality maintained by Śaṅkara. The Brahman is not only the material

and efficient cause of the extant ones, but is also the "Brahman second to none," seen from the height of realization. That is to say, that from the perspective of the *vidyā*, placed before the cause, the effect disappears. This can be understood from a theory that presupposes inferior realities, such as the reflection of the highest reality, since the reality of the image truly resides in the model.<sup>58</sup> According to what was previously said, it is also valid to maintain that since the effect is a pure reflection and as effect, it is unreality, no matter how it is produced by the cause.

The illustration of the spider producing its web gives us a clarification of the cause/effect relation. In the first place, the fact that the spider extracts the web from its own organism, tells us that the producing nature is at the same time an efficient and material cause since the spider needs neither an exterior matter to construct its web, nor makes it ignorantly, but according to a determined natural plan. But although it is certain the spider is the productive agent of the web, it would be arbitrary to affirm that the web as such, forms part of the spider's essence. No, in the spider resides the faculty to produce the web, but the spider is not the web. In any given moment, the means of producing the web is within the spider, and the web started to exist either formally or inwardly in order to exteriorize afterwards.<sup>59</sup> These moments reveal the three metaphysical states: the Brahman, the unmanifest and manifest. Consequently, the truth of the essence of the productive cause is rooted here. The cause produces because it has the potency or the faculty to produce, not because it has the undeveloped germs which will later become developed. In the cause—if we look at it well—is the possibility of producing all the effects and it is in a similar sense that the effect is in the cause. If the pre-existence of the effect on the cause should mean its mere germinal existence, the Brahman would shelter prefigurations, which is impossible, considering his status of transcendence, and the effect would be in the cause not as something different from it, but as part of it. This

explains that Śaṁkara can talk about the only and true existence of cause, the Brahman which also is the principle of dissolution. This does not mean that the manifest is ultimately reabsorbed into the cause, and therewith nullified. That notion is impossible if the effect is understood as reflection. Wisdom then is simply the recovery of what is reflected under its true face.<sup>60</sup>

### III. Plotinus and Śaṁkara

The order itself in which we have developed this writing permits us to explore analogies existing between the two thinkers we have dealt with.

Both Plotinus and Śaṁkara conceive of the Real as the highest plane of Reality. The One and the Brahman are the revelation of a mystical experience and both exceed, as pure Possibility, every attempt of determination. In fact, the delimiting includes form, and form cannot exist without matter, its necessary correlative. Therefore, form and matter are totally alien to the Principle; it is the Nothingness.

Matter/*ajñāna/māyā* is the other part of the first Principle, but it is not independent from It. Consequently Matter surges from It, as the determining capacity, but without being in It.

Matter is just as much in the spiritual as in the sensible world, as the *ajñāna/māyā* is in the *Īśvara* (what is not manifested) and *nāmarūpa* (what is manifested).

The One/Brahman irradiates through its own perfection the remaining characters of reality. These characters, therefore, are images, which reveal in an imaginary manner the superior immediate reality, according to the level of reflection. In both cases, the matter/*ajñāna/māyā* constitutes the reflecting medium necessary for the image to exist.

An equivalent conception concerning the degrees of being, likewise illustrated by literary images that manifest the same

comprehension of the ontological theory of the image, permits both authors to develop a similar notion of the metaphysical participation, which is based on the recognition of the superessential identity manifested under the form of the image. In like manner, the Greek and the Indian philosophers maintain the same theory of essential causality, in which the productive cause is the true and sole reality, and the effect, an irradiation reclaiming its cause, which differs from the former, in so far as its manifestation and nothing as a reality since its reality consists in the object it reflects.

In spite of similar doctrinal analogies, both thinkers clearly show genuine peculiarities, related to their corresponding traditions of thought, Greek and Hindu. Both Plotinus and Śaṅkara respond with their central intuitions to the problems posed by an environment and a set of themes rooted in said environment. It is due to this that there are differences in the exposition of the theme. At first glance, Plotinus appears to be more analytical and coherent, while Śaṅkara is presented as being more synthetic and dispersed. Both are, without doubt, speculative geniuses of the noblest race, but the religious tradition that motivates the second man is more philosophically appeased in the first.

There is a question that remains. How has it been possible for two metaphysicians geographically and temporally so distant and with such diverse cultural traditions to agree on the essential points of their doctrines? These reasons could be pointed out: (a) in regards to the central and supreme intuition of both thinkers, a mystic nature stands out; (b) in relation to their form of predominant discursive and symbolic exposition and in relation to their mutual logical demands displays their similar psychic-speculative and intellectual temperament; (c) in the posing of the religious problems from a philosophical perspective in which identical themes and assumptions arise, one would be able to add the stimulus that can represent a common civilizing Indo-European background since it gave rise to the two unique philosophical traditions that we know: the Indian and the Greek.

## NOTES

1. What follows is a condensed summary of a more ample exposition, which for reasons of space, have had to be limited. The critical and bibliographical notes have been likewise reduced to the indispensable minimum.
2. Cf. *Enn.* II.4.3.1-16.
3. Cf. *Enn.* II.4.4.
4. Cf. *Enn.* II.4.5.4-8. Here *buthos* is equal to substratum.
5. Cf. *Enn.* II.4.5.1-4.
6. Cf. *Enn.* II.4.5.8 ff., and previously V.4[7].2, VI.9[9].2 and V.1.10.6-7. Can likewise be seen in comparison with our interpretation: R. Aron, *Le désir de Dieu* (Roma, 1967), pp. 70 ff.; J. Trouillard, *La Procession Plotinienne* (Paris, 1955), pp. 14-20; J. M. Rist, "Plotinus on Matter and Evil," *Phron.*, 6 (1961), pp. 155 ff.; J. Igal, "La génesis de la Inteligencia en un pasaje de la *Enéadas* de Plotino," *Emérita*, 39 (1971), pp. 129-157; and in the examination of Ph. Merlan in *From Platonism to Neoplatonism*, pp. 133 ff., which includes the position of Armstrong and other specialists.
7. Cf. *Enn.* V.1[10].4.
8. Cf. *Enn.* II.4.6-15. In support of II.4.11 for the concept of mass, see also III.6[26].16-17, and from II.4.15.13-37: "as the archetype differs from the image," *Enn.* V.8[31].7.23-24.
9. See the second paragraph of the paper. There is also in this treatise a brief examination of the gnoseological status of matter (II.4.10 and 12.26-37), which is consistent with all the Plotinian exposition. As undefined depth, it is the component of all that can be known through the spiritual or sensible intuition. Therefore, it is only apprehensible in the entirety that is experienced and in itself is unrecognizable (unknown). But the experience of the cognitive synthesis allows us to elevate even what the knowledge gives it, or will stop in the synthesis, to describe logically its constitution; this latter will be legitimate, but also problematic. Nevertheless, it will be the capability to be known of the component. Matter is the limitative (restrictive) case as the opposite to the true knowledge. Therefore, the introspective activity of the soul will be equivalent to emptying itself of the positive and residue will be pure possibility of knowing or a "spurious reasoning," as Plato would say.
10. Negative notions: matter is not body (*Enn.* IV.7[2].8.1.12-16, 28 ff.; V.9[5].3.19-20; 4.8-12; 6.15 ff.; V.1[10].2.23 ff.). Positive notions: matter in the spiritual and in the sensible (V.9[5].3.19-20; 14; V.1[10].4.26 ff.; and V.17); multiplicity and composition in the Spirit (V.9[5].7-8; V.4[7].1; VI.9[9].2.3.5; V.1[10].6.28 ff.;

- 7.22; V.2[11].1; V.9[5].3.19-20; and V.4[7].2); form matter inseparability in the spiritual dominion (V.9[5].5; 10.6 ff.); spiritual paradigms and cosmic images (V.9[5].5); substrate and receptacle (V.9[5].5.37; 9.8-10; V.1[10].3.28-31); Otherness (V.9[5].8.28-31; IV.9[8].33 ff.; VI.9[9].6.42; V.1[10].1.4; 6.53); undefined and amorphous (V.9[5].3.19-20, also *in fine*; VI.9[9].7); receives qualities and quantities (V.9[5].10.6 ff.); collaborates in the spiritual or sensible actualization (V.9[5].12); multiplies and divides (IV.9[8].5); its presence makes the One to be desired (VI.9[9].5.9; V.2[11].1); to corroborate what was said, the first hypostasis is simple, one, perfect, etc. (V.9[5].2.26-27; V.4[7].1; VI.9[9].9 ff.; V.1[10].7).
11. Matter in the spiritual and sensible (*Enn.* II.5[25].3.8-13, 31-40; VI.4[22].4.20 ff.); substrate and undefined receptacle, amorphous and indeterminate (II.5[25].4.12; IV.3[27].9-10); pure disposition (II.5[25].4.3-5); the otherness (VI.4[22].11.17; II.5[25].4.6-11; 5 *in initio*; IV.3[27].4.9-12); precarious gnosological condition (II.5[25].5).
  12. Cf. likewise *Enn.* V.5[32].9.
  13. Cf. *Enn.* III.8.11.26-45 and V.8.1 ff. See also V.5[32].12.
  14. Cf. *Enn.* V.8[31].1-3. *Enn.* II.9[33].17 presupposes it.

48. Cf. *SB* I.1.19 (I, p. 74), I.1.24 (I, p. 92), II.2.3 (I, p. 111), I.3.13 (I, pp. 171-4), and II.1.28 (I, p. 352); Radhakrishnan, *Indian Philosophy*, pp. 572-3.
49. *SB* passim. Cf., briefly, Dasgupta, *Indian Philosophy*, p. 439.
50. *SB* I.4.3 (I, p. 243), I.4.6 (I, p. 251), II.1.14 (I, p. 329), II.1.28 (I, p. 352), II.1.31 (I, p. 355), and IV.3.14 (II, p. 401); *VCM*, pp. 227, 237-8, 243, 514; *SB Mānd. Up.* II.19 (śloka), III.10 (śloka), III.15 (śloka). See Radhakrishnan, *Indian Philosophy*, pp. 565 ff.
51. *SB* II.1.36 (I, p. 360) and III.2.35 (II, p. 179); *SB Mānd. Up.* I.16 (śloka). Also see Radhakrishnan, *Indian Philosophy*, pp. 587-90.
52. *SB* II.3.50 (II, p. 68); *VCM*, p. 243; *SB Mānd. Up.* III.6 (śloka *in fine*).
53. *SB* II.1.4 (I, pp. 329-30) and III.2.21 (II, p. 163); *VCM*, pp. 260, 345; *SB Mānd. Up.* I.18 (śloka *in fine*). See Radhakrishnan, *Indian Philosophy*, pp. 578-87, 590-94.
54. Cf. *VCM*, p. 343 and, later, *DDV* 13, 35. There is more. *Māyā* has three *guṇas*: *rajas*, *taṃas* and *sattva* (*VCM*, p. 110); and as something undifferentiated (*VCM*, p. 108), it is a perfectly balanced state of the *guṇas*. (Therefore, it is said that the *avṛti* "initiates the action of the projecting capacity" (*VCM*, p. 113), and that it is *Kāraṇa-Śarīra* of the *Ātman* (*VCM*, p. 120).) That is to say, the *māyā-avyakta* or *añāna* is the equivalent of the Plotinian spiritual matter. But in Śaṅkara as in Plotinus the dialectical analysis is possible. First the *sattva* has the "divine tendencies and turning away from the unreal" (*VCM*, p. 118), and second, the *rajas* "has *viksepa-śakti* or projecting power" (*VCM*, p. 111), and the *taṃas* has the *avṛti* or veiling power (*VCM*, p. 113), that is to say, the aspiration upward and the *tolma* of Plotinian matter. Moreover, both powers are in *nidrā* (*SB Mānd. Up.* 1.13 (śloka) and, later, *DDV*

- 38). Remember the *babarménos noûs* of Plotinus (*Enn.* III.8[30].8,34). See likewise *SB Mānd. Up.* 1.15, 1.17, and IV.94 (śloka).
55. *SB* I.2.6 (I, p. 113), I.2.20 (I, p. 135), and I.4.6 (I, p. 251). *SB Mānd. Up.* II.16 (śloka), II.28 (śloka), and II.32 (śloka). See Radhakrishnan, *Indian Philosophy*, pp. 557 ff.
56. *SB* III.2.21 (II, pp. 162-3). *VCM*, p. 569. *SB Mānd. Up.* IV.44 (śloka). See Dasgupta, *Indian Philosophy*, pp. 486-7.
57. *SB* II.1.6 (I, pp. 307-8), II.3.50 (II, pp. 68-9), III.2.18-21 (II, pp. 157-9), III.2.26 (II, p. 173), and III.2.35 (II, p. 179). *SB Mānd. Up.* I.6 (śloka), II.30 (śloka), II.31, and IV.98 (śloka).
58. *SB* II.3.17 (II, p. 32), III.2.41 (II, p. 183), and IV.4.15-16 (II, pp. 414-15). *VCM*, pp. 223, 226, 230. *SB Mānd. Up.* III.18 (śloka), III.23 (śloka), and IV.90 (śloka). Also see Martin-Dubost, *Çankara et le Vedānta*, p. 63.
59. *SB* I.4.27 (I, p. 288) and II.1.24 (I, pp. 346-7).
60. *SB* I.4.14 (I, p. 266), I.4.21 (I, pp. 277-8), I.4.22 (I, p. 280), I.4.28 (I, p. 289), II.1.1 (I, p. 290), II.1.8 (I, p. 309), II.1.9 (I, p. 311), II.1.14 (I, p. 320), II.1.15 (I, p. 331), II.1.16 (I, p. 332), II.1.18 (I, p. 341), II.1.28 (I, p. 353), II.1.30 (I, pp. 354-5), II.1.31 (I, pp. 355-6), and II.4.20 (II, pp. 97-8). Śaṅkara, *Aparokṣānubhūti* 138 (*Select Works*, p. 82). *SB Mānd. Up.* I.13 (śloka), III.27 (śloka), III.48 (śloka), IV.38 (śloka), IV.42 (śloka), IV.52 (śloka), IV.54,55-7, IV.93 and IV.95 (śloka). Furthermore, if the effect does not exist, neither does the *māyā* (*añāna*), which is its possibility. See *SB Mānd. Up.* IV.38 (śloka). One may compare equally the gnoseological status of *māyā* (*VCM*, p. 109) with the mentioned status of matter in Plotinus.

## Śaṅkara and Eriugena on Causality

---

Russell Hatton

*University of Delaware  
Newark, Delaware*

Eriugena, in the *Periphyseon*, and Śaṅkara, in his commentary on the *Brahma Sūtra* of Bādarāyana, are occasionally concerned to establish the truth of a proposition of the type:

(1) A is the cause of B.

In the course of defending their causal assertions, both Eriugena and Śaṅkara sometimes raise objections of the type:

(2) A cannot be the cause of B because A has characteristic<sup>1</sup> *x* while B has characteristic *non-x*.

Having raised such an objection to their causal assertions, Eriugena and Śaṅkara sometimes go further and offer as an objection a general assertion about the nature of the causal relation of the type:

(3) If A is the cause of B, then A and B must share certain important characteristics.

In addition to offering the same types of objections to causal assertions, Eriugena and Śaṅkara offer replies to them which are similar and fall into two main categories. Sometimes the objection is tackled directly and a proof that A is the cause of B is given, which either appeals to Scriptural authority or does not. At other times the reply is based upon a causal analogy. The causal relationship of A and B has been called into question because A is *x* but B is not *x*. Thus a causal analogy is presented, i.e., a pair C and D such that C is acknowledged to be the cause of D but C is *y* while D is not *y*.

The following will be a detailed consideration of several instances in which each philosopher is concerned to defend a causal assertion against objections of the types mentioned above.

### Corporeal Effects and Their Causes

#### *Eriugena*

The "fact" that incorporeal causes can have corporeal effects is mentioned twice in Book One of the *Periphyseon* before the possibility of such a causal relation is ever questioned.<sup>2</sup> The question is finally discussed during a consideration of the relation of *ousia* and its natural accidents to bodies and their accidents (PI 163-71; PL 498B-501C). The Teacher tells the Student that *quantu* and *qualia*, the accidents of bodies, are the effects of the incorporeal quality and quantity which subsist in *ousia* as its natural accidents.

The student wishes to know how this is possible, for the causes in this case are incorporeal and invisible, immutable, and intelligible while bodies are visible and corporeal, mutable, and sensible. "How then can quantity and quality produce matter, which is something very different from them?" he asks, and "why is what is understood of the causes not also understood of their effects? . . ." (PI 165; PL 499A).

The Teacher proceeds to demonstrate that incorporeal causes do, in fact, have corporeal effects (PI 165-7; PL 499B-501B). The basic presupposition of this demonstration is that all corporeal things are a combination of form and matter and that there is no third component in addition to these. This is not stated explicitly by Eriugena. The Teacher begins by eliciting the Student's agreement that unformed matter is contemplated by reason rather than sense. The student then agrees that since formless matter is contemplated by reason, it is incorporeal. The Teacher notes that this conclusion is confirmed by authority and cites Augustine, Plato, and the pseudo-Dionysius. Dionysius is quoted as saying that "matter is participation in adornment and form and species, for without these matter is formless and cannot be understood in anything" (PI 169; PL 500D). The Student agrees that "the species and form and adornments themselves, by participation in which that formless or mutability we mentioned is changed into matter" (PI 169; PL 501B) are contemplated by reason alone. Since form too is contemplated by reason rather than sense, it is incorporeal. But this is all that is needed and the demonstration is completed, as "now you see that from incorporeal things, namely mutable formlessness which yet is receptive forms, and form itself, something corporeal, namely matter and body, is created" (PI 171; PL 501B).

As it is evident from the above, Eriugena's concern is to demonstrate that the causes of bodies and their effects do not share the particular characteristics of corporeality, incorporeality, mutability, immutability, simplicity, and composition. He is not concerned to explain here, or elsewhere, why these particular characteristics are not shared, and why those characteristics (if any) which are shared are shared. Such an explanation would require an explicit discussion of the nature of causation *per se*, something which is not found in the *Periphyseon*.

*Śaṅkara*

Śaṅkara is not particularly concerned with the question Eriugena considers rather carefully, "Can incorporeal causes produce corporeal effects?" He does however, give it a passing glance. This occurs in his commentary on *Brahma Sūtra* 1.1.21.<sup>3</sup>

The question at issue here is the exegetical one of whether the "source of all beings" referred to in *Muṇḍaka Upaniṣad* 1.1.5-6 is the *pradhāna* (a rival philosophical school's version of prime matter), the soul, or *Brahman*.

A *pūrvapakṣin* (hypothetical opponent of Śaṅkara's position) argues that since earth and other non-intelligent things are given as instances of "sources" in *Muṇḍaka Upaniṣad* 1.1.7, the source of all beings must also be non-intelligent. Śaṅkara's arguments against this position are mainly exegetical, but his last argument replies to the *pūrvapakṣin*'s interpretation of the analogies of the passage. The contention, says Śaṅkara, that since the parallel instances are non-intelligent, the source of all beings, to which they are compared, must also be non-intelligent is baseless since "it is not necessary that two things of which one is compared to the other should be of absolutely the same nature" (*BS* 1.2.21; 1:139). Concluding the discussion, Śaṅkara says that, "The things, moreover, to which the source of all beings is compared, viz. the earth and the like, are material, while nobody would assume the source of all beings to be material" (*BS* 1.2.21; 1:139).

This treatment appears to be the only consideration in Śaṅkara's commentary on the *Brahma Sūtra* of the question, "Can incorporeal causes produce a corporeal effect?" He apparently considered it unworthy of serious attention.

## God and Brahman and Their Effects

*Eriugena-One*

In Chapter Five of Book Three of the *Periphyseon* Student and Teacher discuss at length how all things can be both eternal in God's Wisdom and also made from nothing. At one point they discuss the question whether formless matter is also created from nothing.<sup>4</sup> Certain "secular philosophers" have insisted that it could not be, and have said that formless matter is coeternal with God. They cannot see how that which is formless, variable, subject to accidents, extended in place and time, receptive of different qualities, corruptible, and compound can come into being from that which is the form of all things, invariable, subject to no accidents, not extended in time or space, subject to no quality, incorruptible, and simple.

But, Teacher continues, we must not doubt that "He who made the world from formless matter also made formless matter from absolutely nothing..." (*P2* 144; *PL* 636D). The Teacher then offers support for this doctrine. In the first place this is the teaching of Scripture. Secondly, such objections are incompatible with the conception of an omnipotent creator.<sup>5</sup>

Eriugena devotes little attention to this objection, and his first reply appears to be misdirected. It is doubtful that "secular philosophers" will be particularly impressed with an appeal to Scripture. The second reply is perhaps being offered as an alternative to an appeal to Scripture. The question then becomes, "What is our source of knowledge of God's omnipotence?" If it is Scripture, then this reply would also be misdirected.

In any case, Eriugena seems to feel that this objection is hardly worthy of note, much less two discussions directed at two different audiences. Throughout the *Periphyseon* he presents a mixture of philosophical and scriptural proofs of his doctrines. At no point does he indicate that he is aware

that objections raised by philosophers who do not recognize the authority of Scripture must be handled quite differently from objections raised by those who accept it. As the discussion of Śaṅkara which follows will show, the distinction between philosophy and theology seems to have been made earlier in India than in Europe.

### *Eriugena-Two*

In Book Two of the *Periphyseon* there occurs an extended discussion of the primordial causes—that which is created and creates. At one point the Student asks if the primordial causes understand themselves before they flow into the things of which they are the causes.<sup>6</sup> The Teacher replies by first pointing out that God made the primordial causes in His Wisdom. Since God's Wisdom knows herself and the things that are made in her, the primordial causes are wise and not only know themselves but the things of which they are the principles. The Student then asks, "If the primordial causes have wisdom of themselves because they are created in Wisdom and subsist eternally in that which admits nothing unwise in itself, how is it that from the wise causes many unwise things proceed?" (P2 67; PL 552B). After giving examples of wise effects of the primordial causes as well as effects devoid of wisdom, the Student answers his own question. The rays of the sun are not dark, he observes, but the causes of darkness inhere in them. Thus the causes of unwise things can subsist in the wise primordial causes. Recalling that in an earlier presentation of this example Eriugena had said that the causes of shadow *are* body and light rather than *inhere in* body and light (PI 171; PL 501C) and Eriugena's earlier statement—"I see no reason why whatever proceeds from those things which are in the source should not be traced back to that very source" (PI 165; PL 499A)—it would be reasonable to conclude that the wise primordial causes can have unwise effects.

Now the question might be asked, "What does the fact that the sun's rays are not dark but they are the causes of shadows which are dark have to do with the possibility that wise causes can have unwise effects?" When the Student asks rhetorically, "If the primordial causes are wise, how is it that from these wise causes many unwise things proceed?" he could have had the following in mind:

(4) If A is the cause of B then A and B must share all characteristics.

But this is obviously much too broad. It says, in effect, that cause and effect must be identical. Admittedly, if the Student did have this in mind then the causal relation between the sun's rays and shadows would be a counter-example that would refute the principle.

A more reasonable objection would be something like:

If A is the cause of B, then A and B must share certain important characteristics or types of characteristics.

For example, one might object that if A is the material cause of B then A and B must either both be corporeal or both incorporeal, or if A is the cause of B, B must share A's essential characteristics. Such a more specific objection would mean that the counter-example works only if the relation of wisdom to the primordial causes and light to the rays of the sun are the same. Whatever the type of objection Eriugena had in mind, however, he gives it so little attention he can hardly have taken it seriously. This might suggest that he had in mind the former of the two objections mentioned above.

### *Śaṅkara*

Śaṅkara wishes to prove that Brahman is the material or substantial cause (*upādāna kāraṇa*) of the world in addition to being the operational or efficient cause (*nimitta kāraṇa*) (BS

1.4.23; 1:283-4). Three times in his commentary on the *Brahma Sūtra* he deals with an objection to this doctrine of the following type:

(5) The world is seen to consist of parts, be non-intelligent, and impure but Brahman is known to be without parts, intelligent and pure. But material cause and effect must share these characteristics. Thus Brahman cannot be the material cause of the world.<sup>7</sup>

Śaṅkara's first reply to this type of objection is that we must conclude that Brahman is both the material and operative cause of the world because this is the only assumption that allows us to make sense out of key scriptural passages (BS 1.4.23; 1:284). Passages such as *Chāndogya Upaniṣad* 6.1.3-4 suggest that through the cognition of Brahman everything else becomes known, but this is possible only through the cognition of the material cause. This is because the effect is "non-different" from the material cause while it is not "non-different" from the operative or efficient cause. Thus, knowledge of the operative cause alone cannot result in knowledge of the effect.

Notice that at this point, Śaṅkara's appeal to Scripture does not deal with the *pūrvapakṣin's* contention that the material cause and effect must be "of the same nature" or "alike in kind." This is because he is dealing at this point with an opponent who also accepts the authority of the *Vedas*.<sup>8</sup> Śaṅkara deals with opponents who do not accept the authority of Scripture later.

It should be pointed out that Śaṅkara considers an appeal to Scripture—"proof by demonstration of the connected meaning of all the Vedānta texts"—to be the final justification for any assertion about Brahman. This is made explicit in his commentary on 1.4.27. Here Śaṅkara notes that Brahman is the material cause of the world because it is called the "source" (*yonī*) in the sacred texts, and that the word

"source" is used in ordinary language to denote the material cause. A *pūrvapakṣin* raises the objection that ordinarily the operative and material causes are different. Śaṅkara dismisses the objection, saying that "as the matter in hand is not one which can be known through inferential reasoning, ordinary experience cannot be used to settle it. For the knowledge of that matter we rather depend on Scripture altogether, and hence Scripture only has to be appealed to" (BS 1.4.27; 1:288).

Śaṅkara's second reply to the type of objection characterized above (5) occurs in a section in which he deals with objections to his position founded on "reasoning" alone (BS 2.1.4-6; 1:299-308). After stating the objection, the first thing Śaṅkara does is to reject one possible defence of his view. This is the assertion that Brahman and the world do share the characteristic of intelligence but that the intelligence of the world is not apparent, just as a man's intelligence is unmanifested in certain states such as sleep. He argues that even if such reasoning explained the difference of characteristics between the intelligent Brahman and the non-intelligent world, there are other characteristics not shared as well. More important, neither perception nor inference supply evidence that the entire world is intelligent. Thus such an assertion could be proven only by an appeal to scriptural evidence. But Scripture itself actually teaches that the world is of a nature different from its material cause—non-intelligent.

Having rejected one possible defence of his doctrine, Śaṅkara replies that "Your assertion that this world cannot have originated from Brahman on account of the difference of its character is not founded on an absolutely true tenet" (BS 2.1.6; 1:305). The objection in this case had been that "things of an altogether different character cannot stand to each other in the relation of material cause and effect" (BS 2.1.4; 1:300).

In the first place, notes Śaṅkara, "we see that from man, who is acknowledged to be intelligent, non-intelligent things such as hair and nails originated, and that, on the other hand,

from avowedly non-intelligent matter, such as cow-dung, scorpions and similar animals are produced" (BS 2.1.6; 1:305). Secondly, even if it is agreed that the non-intelligent human body is the real cause of the non-intelligent hair and nails and that the non-intelligent dung is the cause of only the bodies of the scorpions, the causes and their effects in these cases would still have different characteristics. The body of the scorpion would be a kind of non-intelligent matter with the characteristic "capable of serving as the abode of an intelligent principle" while the dung would be a kind of non-intelligent matter with the characteristic "incapable of serving as the abode of an intelligent principle." This would be an obvious difference in characteristics. Also, the differences in characteristics between men's bodies on the one hand and their hair and nails on the other is quite considerable.

Since the question at issue here is whether the intelligent Brahman can be the material cause of a non-intelligent effect, the relevance of the first counter-example to the *pūrvapakṣin*'s objection is obvious. The relevance of the second and third counterexamples, however, is problematic. The differences in characteristics between dung and a scorpion cannot be denied. But they also share other important characteristics—corporeality, for example. Thus Śaṅkara seems to be interpreting the *pūrvapakṣin* as saying that if A is the cause of B, then B must share *all* characteristics of A (4). As was mentioned in connection with Eriugena's dealing with the question "How can wise causes have unwise effects?", such an interpretation of the objection is so broad that it renders it trivially false.

Śaṅkara, however, goes on to consider systematically the notion of difference in characteristics of the cause and effect that the objection hinges on.<sup>10</sup> He notes that a person who insists that Brahman cannot be the material cause of the world because of the "Difference of attributes" must mean either that:

1. The world has none of the characteristics that Brahman has and the cause and effect must share at least one characteristic; or
2. The world lacks some of the characteristics that Brahman has; or
3. The world lacks some specific characteristic of Brahman such as intelligence.

Śaṅkara then discusses these alternatives.<sup>11</sup> In the case of the first, the assertion is false. The world and Brahman do indeed share a characteristic, *sāttā* (existence). According to the second alternative Brahman cannot be the cause of the world because the world does not have all the characteristics Brahman has. But if the effect must have all the characteristics that the cause has, this would "negate" the relation of cause and effect, "for if the two were absolutely identical they could not be distinguished" (BS 2.1.6; 1:306). Finally, in reference to the third alternative, Śaṅkara says that when a person insists that the world cannot be an effect of Brahman because it lacks the characteristic of intelligence, he is arguing as follows:

Whatever is devoid of intelligence cannot be an effect of Brahman.

The world is devoid of intelligence.

Therefore, the world is not an effect of Brahman.

The truth of the minor premise is obvious. Thus the basic problem for an opponent of Śaṅkara is the proof of the major premise. Śaṅkara is convinced that Scripture unequivocally indicates that Brahman is the cause of all effects. Thus scripture cannot be the source of our knowledge of the truth of the major premise. An opponent cannot advance an inductive proof of the major premise because the *only* source of knowledge of Brahman is scripture. Any example which the opponent might advance as evidence of the major premise would be denied to be such by the Vedāntin.

In spite of the fact that Śaṅkara said he would deal in this section with objections to this position based on reasoning alone, he finds himself unable to refute the most sophisticated of them without an appeal to Scriptural authority. Śaṅkara's non-orthodox opponents (those who do not accept the authority of the *Vedas*) are no more likely to be impressed by an appeal to Scripture than the "secular philosophers" Eriugena mentions as objecting to the doctrine that God created formless matter out of nothing.

Śaṅkara's third reply to the type of criticism of his doctrine of Brahman as the material cause of the world outlined above (5) arises during his critique of the Vaiśeṣika doctrine of atomism (*BS* 2.2.10-11; 1:376-86). Śaṅkara begins by showing that the Vaiśeṣika system is just as vulnerable to the criticism they make of his system as his own. Thus an essential part of his reply is a summary of the Vaiśeṣika system (*BS* 2.2.11; 1:382-3) the relevant portions of which are:

1. Atoms are spherical and possess color and other characteristics;
2. When two atoms conjoin to produce a binary compound, the characteristics of the atoms produce corresponding characteristics in the binary compound, except that though the atoms are spherical, the binary compound is not, it is 'minute and short';
3. When two binary compounds conjoin to produce a quaternary compound, once again most of the characteristics of the binary compound produce corresponding characteristics in the quaternary compound, except that though the binary compounds are minute and short, the quaternary compounds are 'big and long'.

Of course, given this summary, Śaṅkara's line of argumentation is obvious. He simply points out that the "forms of extension" of the parts do not produce corresponding qualities in the compounds. Thus the intelligent Brahman can be

the cause of the non-intelligent world and the non-acceptance of this possibility would require the abandonment of a fundamental principle of the Vaiśeṣika.

Now, continues Śaṅkara, the Vaiśeṣikas might try to answer the criticism (*BS* 2.2.11; 1:383-5). The forms of extension of the components, they might argue, do not produce corresponding qualities in the compounds because the compounds are "engrossed" by forms of extension contrary to that of the components, and thus the components cannot produce similar characteristics in the compounds. This principle of "engrossment" cannot be similarly invoked by the Vedāntins, the Vaiśeṣikas might further maintain. Non-intelligence, an obvious quality of the world, is not a quality contrary to intelligence but simply the absence of intelligence. Thus the world is not engrossed by some quality contrary to intelligence which keeps the intelligence inherent in the cause from producing intelligence in the effect. Thus, the Vaiśeṣikas would conclude, the two cases of causality being compared are dissimilar in important ways and the intelligence of the cause—Brahman—would be expected to be manifested in the effect—the world.

The question is thus, "How acceptable is 'engrossment by contrary forms' as an explanation for the difference in characteristics between cause and effect?" Not at all, insists Śaṅkara. In a very terse section not notable for its clarity (*BS* 2.2.11; 1:383-5) he rejects this explanation of the fact that certain characteristics of the cause do not produce corresponding characteristics in the effect.

Though the section is quite difficult, the most important thing to note is Śaṅkara's conclusion after rejecting the alternative explanation of why cause and effect do not share certain characteristics. He concludes that the fact that sphericity, for example, is a characteristic which need not be shared by cause and effect can be explained only on the assumption that this is the result of the essential nature of sphericity. But such a contention can certainly be made by Śaṅkara about the intelligence of Brahman. Thus the Vaiśeṣikas must agree

with the Vedāntins that some causes do not produce like effects and thus the intelligent Brahman can produce the non-intelligent world.

Notice that the Vaiśeṣikas are not arguing that the cause and effect do indeed share all characteristics but this fact is not always apparent. They argue instead that the effect shares the characteristics of the cause unless it is "prevented" from doing so. Śaṅkara is forced to reject this type of causal theory because it would require the postulation of something other than Brahman to "prevent" the Brahman's intelligence from being a characteristic of the world. The postulation of something "other" than Brahman would severely compromise Śaṅkara's monism to say the least. Thus Śaṅkara must argue that the non-sharing of characteristics by cause and effect is due to the nature of the cause alone and to no other thing.

#### Concluding Remarks

The thrust of Śaṅkara's replies to the criticisms of his assertion that Brahman is the material cause of the world appears to be towards the principle that cause and effect need share no characteristics. It might be remembered that at one point he replies to the insistence of a *pūrvapakṣin* that cause and effect must share at least some characteristics. He points out that Brahman and the world do indeed share one characteristic—*sāttā* (existence). However, it should be mentioned that elsewhere Śaṅkara apparently argues that real effects can result from unreal causes, as when a man dies after imagining himself to have been bitten by a venomous snake.<sup>12</sup> Then too, such a statement is not consonant with what might be called the standard interpretation of Śaṅkara's system. Brahman is, among other things, *sāt* (being), while the world, in spite of all the talk about Brahman as its material cause, is "mere illusion or *māyā*,"<sup>13</sup> "only an illusory imagination which lasts till the moment when true knowledge is acquired,"<sup>14</sup> etc. The key analogy of the relation of Brahman to

the world is that of the magician to his illusion.<sup>15</sup> An illusion, says Śaṅkara, is neither *sāt*—"since it does not continue to manifest itself in all times, and has its manifestation up to the moment that the right knowledge dawns"<sup>16</sup>—but neither is it *asāt*, for it is not absolutely non-existent in the sense that a hare's horn or the son of a barren woman are non-existent.

If pushed by cogent criticism of key parts of his system, Eriugena would probably have been forced to take refuge in the principle that the cause and effect need to share no characteristics. It has already been pointed out that he tends to "collapse" causality by preferring to view the first term in a causal sequence as the real cause of all subsequent effects. The consequence of such a tendency is exemplified by his many references to God as the cause of all effects. Since nothing which is predicable of God's effects is, properly speaking, predicable of God, we have a most extreme case here of the non-sharing of characteristics by cause and effect.

Many criticisms which Śaṅkara brings forth against his position are based on the expectation that because a cause has a particular characteristic the effect will also have it. His basic job in dealing with such objections is to show, or remind the *pūrvapakṣin* that though the cause has a particular characteristic, the effect need not have it and conversely. Monists like Śaṅkara will have to deal with this basic type of criticism at every turn, but certain problems which even non-monists have would seem to be amenable to an insistence that there is no characteristic which cause and effect must share. The problem of evil and that of the interaction of mind and body are two that come to mind.

Perhaps if this paper does nothing else it points out the correctness of the common characterization of Eriugena as, for example, "a mind of great power, hampered by the limitations of his time and by the poverty of the material at his disposal."<sup>17</sup> Śaṅkara's discussions of the problems dealt with in this paper are obviously the more complete and sophisticated. Śaṅkara's work is obviously the product of a much more sophisticated and pluralistic philosophical environment. We are

reminded that the "dark ages" was not a global phenomenon and that good philosophy was not and still is not limited to Europe.

## NOTES

1. I am using "characteristic" as the genus, of which "essential characteristics" and "accidental characteristics" are the species. For example, Russ Hatton's characteristics would include corporeality, humanity, masculinity, being 5'9" tall, liking beer, having a hang-over today, etc. "Characteristic" is as general a term as I can find which is not also a technical term in scholastic philosophy.
2. Iohannis Scotti Eriugena, *Periphyseon (De Divisione Naturae) Liber Primus*, ed. & trans. I. P. Sheldon-Williams, *Scriptores Latini Hiberniae*, VII (Dublin, 1966), p. 121 (*Patrologia Latina*, Vol. 122, 479A, hereinafter referred to as *PL*) and p. 151 (*PL*, 493A). Subsequent references for passages quoted from this work will appear in the text with the abbreviation *P1*.
3. Śaṅkara, *Commentary on the Vedānta Sūtras of Bādarāyana*, 2 Parts, trans. George Thibaut (1890, 1895; reprint ed., New York: Dover, 1962), Part 1, pp. 135-9. Subsequent references for passages quoted from this work will appear in the text with the abbreviation *BS*. The references will be of the form (*BS* a.b.c; 1:xyz). The first three numbers refer to the traditional division of a commentary on the *Brahma Sūtra* into *Adhyāyas* (Books), *Pādas* (Chapters), and *Sūtras* (the particular sentence of the *Brahma Sūtra* being commented upon). The second number (xyz) gives the page reference to Thibaut's translation, Part One.
4. Johannes Scotus Eriugena, *Periphyseon: On the Division of Nature*, trans. Myra L. Uhlfelder, *The Library of Liberal Arts*, 157 (Indianapolis: Bobbs-Merrill, 1976), pp. 144-5 (*PL* 636C-637D). Subsequent references for passages quoted from this work will appear in the text with the abbreviation *P*.
5. *Ibid.*, p. 145 (*PL* 637B). "For the omnipotent Founder of the universe, free from all defects and reaching to infinity, was able to create, and actually created, not only what is like Himself but also what is unlike."
6. Iohannis Scotti Eriugena, *Periphyseon (De Divisione Naturae) Liber Secundus*, ed. & trans. I. P. Sheldon-Williams, *Scriptores Latini Hiberniae*, VIII (Dublin, 1973), p. 63. Subsequent references for

passages quoted from this work will appear in the text with the abbreviation *P2*.

7. See Śaṅkara, pp. 284 (*BS* 1.4.23), 300-1 (*BS* 2.1.4), and 381 (*BS* 2.2.10).
8. See Śaṅkara, pp. xli (Thibaut's Introduction) and 290 (*BS* 2.1.1).
9. The objection is actually stated and replied to twice. An abbreviated version is first presented (*BS* p. 301, line 34 to p. 302, line 6) and then an expanded version (*BS* p. 302, line 6 to p. 303, line 20). The two versions are essentially the same and are not treated separately in the following.
10. Again the objection is raised and answered twice. The difference between the two presentations is not that of abbreviation and consideration at length, but of a less systematic and a more systematic presentation. Again the two versions are essentially the same and are not treated separately in the following.
11. The following discussion of the "assertions" is based on the following passage:

The first assertion would lead to the negation of the relation of cause and effect in general, which relation is based on the fact of there being in the effect something over and above the cause (for if the two were absolutely identical they could not be distinguished.) The second assertion is open to the charge of running counter to what is well known; for, as we have already remarked, the characteristic quality of existence which belongs to Brahman is found likewise in ether and so on. For the third assertion the requisite proving instances are wanting; for what instances could be brought forward against the upholder of Brahman, in order to prove the general assertion that whatever is devoid of intelligence is seen not to be an effect of Brahman?... [The upholder of Brahman would simply not admit any such instances] because he maintains that this entire complex of things has Brahman for its material cause. [*BS* 2.1.6; 1:306]

The third objection obviously applies to the third alternative (see page 219). But if the objections and alternatives are read carefully the objection to the first alternative just as obviously applies to the second and conversely. Thus they will be treated as such. Radhakrishnan apparently fails to notice this problem. Please see his discussion of Śaṅkara's commentary on *Brahma Sūtra* 2.1.6 (*The Brahma Sūtra: The Philosophy of Spiritual Life*, p. 337).

12. Śaṅkara, pp. 324-5 (BS 2.1.14). This passage is problematic. In spite of the fact that at one point Thibaut translates Śaṅkara as saying "as a matter of fact we do see real effects to result from unreal causes," the examples he gives and the subsequent discussion of them do not make it clear whether this is what Śaṅkara meant.

## Union with God in Plotinus and Bayazid

---

Mohammad Noor Nabi

*Aligarh Muslim University  
Aligarh, India*

Porphyry tells us that four times in a state of ecstasy Plotinus was made one with God. He is also said to have been ashamed that he had a body.<sup>1</sup> The last words of Plotinus were, "Now I seek to lead back the self within me to the All self."<sup>2</sup>

In a similar way one day a man asked Bayazid, "What is the Throne (*Arsh*)?"

Bayazid answered, "I am."

He further inquired, "What is the Chair (*kursi*)?"

The Shaikh replied, "I am."

He again questioned, "What are the Tablet (*Lauh*) and the Pen (*Qalam*)?"

The Shaikh said, "I am."

He then investigated about Prophets: Abraham, Moses and Muhammad.

The Shaikh responded, "I am all of them." Then the man talked about angels such as Jibrail, Mikail, Israfil and Izrail. Again the Shaikh uttered, "I am all of them."

The man became silent.

Then the Shaikh explained, "Whoever loses himself in Reality (God), with Reality he becomes Real. If he becomes self annihilated, Reality sees Itself and there is no question of Wonder."<sup>3</sup> It is further said that one day the Shaikh was talking about Reality and was sucking the water of his own mouth and was saying, "I am the wine and even the wine drinker and the cupbearer."<sup>4</sup>

The statements of both, Plotinus and Bayazid, clearly indicate that they uphold the doctrine of Union with God.

But the vital problem is, What do we mean by Union with God?

To understand this problem it would be better first to go through the concept of salvation of Plotinus and then the concept of annihilation (*Fana*) of Bayazid. Salvation, Plotinus says, begins with self-purification and the practice of ordinary moral life. The practice of moral life is not only to avoid sin but it is to do good positively. This leads to the freeing of the soul from all bodily desire and worldly goods and to fixing its attention upon the *Noûs*. And this is possible through dialectics, which for Plotinus is a form of philosophical analysis or the discipline of philosophic thought wherein logic is used as a tool for the analysis of reality. Through this analysis the soul progressively sees itself as soul, then as *Noûs* and then, eventually, as an element of the ultimate. Now and now only is soul prepared for the final ecstasy of re-union with the One.<sup>5</sup> It must be clear at this stage that this concept of salvation of Plotinus is based on his ontological and metaphysical presuppositions and it entails the various stages of "epistrophe," i.e., the return of the soul, stage by stage, to that primal One from which it came.

After Plotinus we now come to Bayazid. Union, in the case of Bayazid, is to annihilate oneself in God. Explaining the concept of annihilation (*Fana*) Bayazid says, "When a man annihilates himself according to the command of God and subsists without depending on his self and the creatures (of God) in expansion (*Bast*) of God; then he becomes annihilated (*Fani*) to subsist and subsistent to annihilate, dead to be

alive and alive to be dead and veiled to be revealing and revealing to be veiled."<sup>6</sup>

The Shaikh further says, "When I attained the stage of proximity (*Mugam-i-Qurb*) to God, God asked me to desire. I replied, 'I have no desire. You (God) should demand something from me'. God responded, 'So long as there is the existence of Bayazid (self) even to an atom's weight, this desire is impossible'.<sup>7</sup>

These statements of Bayazid imply that annihilation means complete absorption of one's own self in the personality of God. In other words annihilation is self-surrender to God and self-surrender demands complete obedience to the command of God. Without complete obedience annihilation is not possible. Bayazid used to supplicate, "Oh God, how long there would remain 'I-ness' and 'Thou-ness' between 'I' and 'Thou'. Please take up my 'I-ness' from the midst so that my 'I-ness' may be with you because I am nothing. Oh my Lord! So long as I am with Thee, I am the most superior to all and when I am with myself, I am the most inferior to all."<sup>8</sup>

And God accepted the prayer of the Shaikh. The Shaikh attained the stage of *Fana Fillah* (Annihilation in God). He himself says, "A voice came from me in me that oh Thou I," i.e., "I reached the stage of annihilation in God."<sup>9</sup>

After the due analysis of Union with God in Plotinus and Bayazid we may infer that Union in Plotinus means the return of the soul from stage to stage to the Primal One and in Bayazid it is the annihilation of the "I"- "thou" relation. But the fundamental issue is, Can we say that the Union with God is an identification of the soul with God?

Before answering this question it would be desirable to examine the concept of "ecstasy" in Plotinus and Bayazid because the Union with God is not a philosophical or rational stage for either, Plotinus or Bayazid; on the contrary, it is purely a state of ecstasy wherein the soul comes into direct contact with the One itself.

Ecstasy, Plotinus says, is the consummation of reminiscence. It is to release the soul from everything except God

which transforms it in such a way that it then perceives what was previously hidden from it. This state will not be permanent until our union with God is irrevocable. Here, in earthly life, ecstasy is but a flash. It is a brief respite bestowed by the favour of the Deity.<sup>10</sup>

The actual term used by Bayazid for ecstasy is *Ghalabat* and *Sukr* (Intoxication). These words denote the rapture of love for God. Ecstasy involves the cessation of human attributes, like consciousness, foresight and choice; and the annihilation of a man's self-control in God, so that only those faculties survive in him that do not belong to the human genus. Ecstasy is not acquired but it is purely a divine gift. It is a stage where the attribution of man's act is to God and a man of ecstasy stands through God.<sup>11</sup> It would be better here to present an ecstatic state of Bayazid.

The author of the *Tazkiratul Auliya* narrates that once in seclusion (in the state of ecstasy and intoxication) the Shaikh uttered, "Subhani Ma azama Shani" (Glory be to Me! How great is My Majesty). When the Shaikh came to his consciousness, the disciples of the Shaikh repeated his utterance to him. The Shaikh replied, "God will be your enemy, if you hear such utterance again and do not kill me." The Shaikh gave a knife to each disciple and instructed them, "If you again hear such utterance from me, you should kill me." The Shaikh again uttered the same thing and as the disciples intended to kill the Shaikh, they saw the entire room full of Bayazid. The disciples were hitting with their knives at Bayazid but the knives seemed as if to hit water. After a little while the huge form of Bayazid came to be little and Bayazid appeared as a finch in an arch. The companions told him his previous state. The shaikh replied, "Here is Bayazid that you see and that [form] was not Bayazid."<sup>12</sup>

From this narration it becomes explicit that ecstasy is a state in which the soul is transformed in such a way that his act remains no more his act but becomes the act of God. Further ecstasy is a temporary phase of the soul which is possible in earthly life.

Thus after the due analysis of the concepts of salvation, annihilation, ecstasy and intoxication we may rightly conclude that Union with God in Plotinus and Bayazid is not the identification of soul with God; on the contrary, it is the absorption of soul in God. Porphyry's statement that in a state of ecstasy Plotinus was made one with God means that Plotinus was fully absorbed in God and absorption was such that there did not remain any separation between them. As a drop of water mixes with an ocean, it becomes an ocean; it never means that a drop of water is identical with an ocean. In like manner when a sufi or a mystic in his ecstasy attains the union with God, it never means that he becomes identical with God; it simply means that his own self becomes annihilated and he subsists in God.

The last words of Plotinus, "Now I seek to lead back the self within me to the All self,"<sup>13</sup> also testifies to this contention. Imam Al-Ghazali, while commenting on "identity" says, "These gnostics on their return from their ascent into the heaven of Reality, confess with one voice that they saw naught existence there, save the One Real. . . . They became drunken with a drunkenness wherein the sway of their own intelligence disappeared; so that one exclaimed, 'I am the one "Real" (*Anal Haqq*) and another, 'Glory be to Me: How great is My Majesty'. . . . Then when that drunkenness abated and they came again under the sway of intelligence (*Aql*) which is Allah's balance scale upon earth, they knew that that had not been actual Identity, but only something resembling Identity."<sup>14</sup>

## Advaita Vedānta and Neoplatonism

R. K. Tripathi

*Banaras Hindu University  
Varanasi, India*

In this paper we are not taking up the historical question regarding the influence of Upaniṣadic thought on Neoplatonism. That is a rather controversial question and probably it can never be settled. Philosophically speaking, it is not a very important question either. What is more important is the question regarding the doctrinal relation between Advaitism and Neoplatonism. The similarities between the two systems have often attracted the attention of scholars. But in philosophy, distinctions are no less important than similarities and so we propose to draw attention to both.

### I

To begin with, we would like to make our position clear about absolutism, because firstly, both Advaitism and Neoplatonism are sometimes regarded as mere monism, and secondly, Neoplatonism is not like other absolutisms found in the West. Mere monism is not absolutism and that for many reasons. Monism can even be materialistic but absolutism is

never so. Monism admits of the reality of the relative but absolutism cannot. So we will try to lay down the necessary features of true absolutism if only to see how far they are found in Neoplatonism and Advaitism in particular and other types of absolutism in general.

Obviously, every absolutism must accept reality as absolute or independent. The absolute must necessarily be infinite and universal or else it will be limited. This characteristic of the absolute rules out every form of dualism though the duality of subject and object or of matter and mind seems to be too difficult to reject. Not only duality, but also the reality of everything relative is denied. This feature does not seem to be there in the absolute of Hegel and Bradley, because we find that in these thinkers what is emphasized is totality and totality itself is taken to be absolute and independent. This totality is no doubt not mere totality but a synthesized and harmonious totality, but nonetheless it is totality; what is rejected is disharmony and contradiction and not the contents of experience or the elements of appearances. But the totality, howsoever harmonious, cannot be regarded as absolute as it is dependent on its parts that are relative. In this way the absolute ceases to be absolute or independent. In other words, there seems to be no real transcendence here. The whole no doubt transcends the parts but that is not the meaning of real transcendence. As we have shown elsewhere<sup>1</sup> real transcendence means independence from appearances or the rejection of the relative as false. If the reality of the relative is accepted in any form, it is bound to affect the absoluteness of the absolute.

But when we say that the absolute must transcend the relative, it may appear as if we were talking of two realms—the absolute and the relative. This is not so. The relatives are not only relative to each other, they are also relative to the absolute in the sense that their reality depends on the reality of the absolute. If the relative were not dependent on the absolute, it could neither conceal the absolute nor would it be necessary to reject it as false. The relative must therefore be shown to be dependent on the absolute. The two are not simultaneously

real; when we know the one as real, the other is not there. The reality of the relative is derived reality and it is not on its own reality that it stands. That is why when the reality of the absolute is discovered, the very legs on which the relative stands are withdrawn. All reality belongs to the absolute and so the relative is shorn of all its claim to reality. The relative is nothing apart from the absolute, it is but a parasite on the reality of the absolute. This means that the absolute is not only transcendent but also immanent. There need not be any opposition between transcendence and immanence, because immanence does not mean that the absolute has really become the relative. What it means is that the absolute appears as relative or is the ground of the appearance of the relative. As absolute it is transcendent and as ground it is immanent. The relative must have the absolute as its ground or else it will become independent and cease to be relative. The absolute of Hegel and Bradley cannot be said to be immanent either, as it is not the ground but the totality of its parts; the immanent must be independent of the parts. The immanent must also be transcendent and vice versa.

Finally, the absolute must not only be at once immanent and transcendent, it must also be somehow knowable. It must be possible for man to have an experiential knowledge of the absolute or else the absolute will remain just an idea or a myth. Here we are facing a serious problem. How can the finite mind of man know the infinite absolute? As knower the mind will be apart from the absolute and if it is not, it cannot know the absolute. In any case the absolute as infinite would not be known and if it were known it would not be all-comprehensive. It appears to be true that the finite human mind cannot grasp the absolute, but this is so only if knowledge is regarded as mental. There can be such a thing as intuitive knowledge or knowledge by being. After all, how do we know our own selves? We are the self and we know it intuitively. The absolute is our very self (*ātmā sarvasya ātmā, ayam ātmā Brahma*) and so there is the possibility of knowing the absolute. The absolute being is non-spatial and non-temporal, its infinity is not the infinity of expanse; it is rather a qualitative infinity (*svarūpatah*).<sup>2</sup> This

knowledge not being admitted, in Hegel and Bradley the absolute cannot be known.

## II

Thus far, we have been dealing with the absolute. Now we will deal with absolutism. As we have said above, it is necessary for absolutism to show the dependence of the relative on the absolute in a manner that the absoluteness of the absolute is not affected in the least. The relative is related to the absolute but the absolute is independent. In other words the relative does not really come out of the absolute; it only appears to be so; that is, the dependence of the relative on the absolute is only epistemic and not ontological. The relative only appears to be there, though really it is not there. This is possible only because of the ignorance of the absolute. If so, it is necessary for every absolutism to have a view of ignorance which makes the appearance of the absolute possible, otherwise the relative will remain an enigma. It is also necessary therefore for every absolutism to accept two levels of knowledge and reality, the empirical and the ultimate (the *vyāvahārika* and the *pāramārthika*). It is obvious that we do not find this distinction in Hegel and Bradley nor do we find a satisfactory view of ignorance.

There is yet another question worth consideration for every absolutism. Is it possible for man, purely on the basis of reason, to assert that there is such a thing as the absolute? Reason at its best may, it seems to us, only speculate about the possibility of the absolute and may accept or reject the possibility. Even if the possibility is accepted, reason cannot positively affirm that the absolute is really there. Even if the possibility is somehow affirmed, is it possible for reason to show the way of knowing the absolute experientially? Certainly not; reason is confined to concepts only. So how are we to be positively sure that the absolute is there, that it can be experienced and that it can be experienced in such and such manner? It is here that we see the

incompetence of unaided reason and the necessity of taking help from scriptures or *śruti*. It is only *śruti* whose message is based on experience that can categorically affirm the absolute and can not only assure us of the possibility of knowing the absolute but can also tell us the way the absolute can be experienced. Our readiness to depend on the scripture or *śruti* is not a mark of dogmatism but a mark of our critical awareness of the limits of reason as also of our earnestness to seek the absolute. An earnest seeker would not make a fuss about the acceptance of *śruti* in the name of the autonomy of philosophy. He has receptivity and humility. Arrogance of the mind and search for the absolute go but ill together.

## III

Let us now turn to Advaitism and Neoplatonism. As every student of the two schools knows, there are striking similarities not only regarding the views of Plotinus and Śaṅkara but also spiritual virtues such as freedom from worldly aspirations and a keen desire to attain the spiritual goal. For Plotinus, as for Śaṅkara, philosophy was a way of life or the light of life rather than mere speculation. Both gave priority to contemplation as against action. In fact we are told that Plotinus used to have ecstasy or *samādhi* as it is called in India. Both believed that spiritual teaching is something secret and sacred and is therefore to be imparted to the chosen few, those who had the necessary cathartic virtues. Both rejected ritualism.

In the same manner there are many points of similarity between the philosophy of Śaṅkara and that of Plotinus. Attention to these similarities has been well drawn by Mead.<sup>3</sup> We may also notice them here. Corresponding to *Brahman*, *Īśvara* and souls of Advaitism we have in Plotinus the conception of the One, the ultimate reality from which proceeds the Nous which in its turn gives rise to World Soul and souls. Like *Brahman*, the One is formless, infinite and universal; it is not only free from external duality but also internal change

(*svagut bheda*); it is not *a* being but the being of beings (*Sat*) and not *a* good but the good (*Anand*). Creation for Plotinus is a kind of radiation or emanation, the essence of which is that it does not affect in the least the source of emanation (*Purnasya Purna Mādaya Purnamevāvaśisyate*). The One alone being real, the world of plurality and change is unreal, matter being a principle of non-being or darkness. Man is essentially one with One (*ayamātmā Brahma*) but until he has realised that unity, he has to go through different births and can be born even as an animal. This unity with the One is of the nature of identity; in other words, man has only to discover his real nature to find that he is the One. This discovery is not merely intellectual, it is a kind of awakening, it is intuitive. Not only moral virtues but also cathartic virtues, especially freedom from desire for enjoyment (*vairāgya*), and the practice of dialectic are necessary for intuitive wisdom or illumination. Nothing remains to be achieved after that (*Āpta Kāma, Akāma*).

#### IV

The philosophy of Plotinus has been characterized in many ways. It is sometimes said to be a blending of Platonism and Aristotelianism.<sup>4</sup> But to us it seems that Neoplatonism is more Platonic than Aristotelian. Plato's distinction between knowledge and opinion; his conception of the Idea of the Good as supreme reality; his use of the simile of the sun as radiating light<sup>5</sup> seem to be dominant in Plotinus and to go against the realism and pluralism of Aristotle. Aristotle's ethical views and his views of dialectic are also different. In the same way, the characterization of Neoplatonism as pantheism or subjective idealism<sup>6</sup> does not seem to be correct. If it is to be called pantheism, it is pantheistic only in the sense in which all absolutism has to be pantheistic, that is, in the sense that reality is the ground of appearance and not in the sense that it has become appearance. We must not ignore the emphasis of Plotinus on negation. As Armstrong puts it, "The essential

feature of this philosophy is the denial of the limitation of the self, of all individual personality."<sup>7</sup> But in no sense is the philosophy of Plotinus to be called subjective idealism as the term is understood in Western thought. It is no doubt idealism in the sense that the supreme reality is spiritual but it is certainly not subjective idealism. The appearance is subjective or false but subjective not in the empirical sense. We stress this point because sometimes Advaitism also is mistakenly called subjective idealism. Even that school of Advaitism (*dr̥ṣṭi śr̥ṣṭi vāda*) according to which the universe is because of our seeing it holds that the ignorance which makes the appearance of the appearance possible is of transcendental nature; it is not subjective in the empirical sense but in the Kantian sense.

#### V

In our view Neoplatonism is better characterized as a kind of absolutism or even Advaitism.<sup>8</sup> Most of the features of absolutism as pointed out above are shared by Neoplatonism. The One is infinite and unchangeable. As transcendent it is beyond thought and speech but as the ground of everything it is also immanent. And though transcendent, it is intuitively knowable as it is one with our real self. The world of plurality and change, though dependent on the One, is false and not real. The whole idea is briefly put in one line by Advaitism, "Brahma satyam Jaganmithyā jiva Brahmaiva nāraḥ" (*Brahman* is real, the world is false, *Brahman* and the self are one and not different). The philosophy of Plotinus, like the philosophy of Śaṅkara, is not mere monism as there is definite denial of change and plurality. It is sometimes said that the world of plurality being an emanation from the One cannot be false and if it is false it cannot be called emanation.<sup>9</sup> There is no doubt that there is some difficulty regarding the idea of emanation, but to us it seems that the very significance of the idea of emanation is two-fold. Firstly, it does not mean any change in the One, and secondly, it does not affect the absoluteness of the

One. If so, the phenomenal world has got to be false. Emanation is neither transformation of the One nor absolute creation but a kind of radiation or overflow which least affects the source. The One only lends reality to or allows itself to be the ground of appearance. This is the freedom of the absolute. Emanation therefore cannot be also understood as emanation in Kashmir Śaivism where *Śiva* and *Śakti* (power to evolve) are one and the world is a real manifestation; but there is no motion in the One of Plotinus.

Although the system of Plotinus comes closest to Advaitism, yet some differences are there. Plotinus no doubt regards the world as appearance and also talks of the fall of man as ignorance of his real self, but he does not elaborate any theory of ignorance or *avidyā* as is done in Advaitism. There seems to be no doubt that Plotinus does not regard ignorance as mere absence of knowledge<sup>10</sup> and takes ignorance to be the source of all evil<sup>11</sup> and matter to be unreal.<sup>12</sup> Ignorance is neither fully positive (*bhāva*) nor utterly negative but apparently positive (*bhāva rūpa*) or different from both. Advaitism makes it clear that ignorance is not positive because it is negated and it is not wholly negative as it gives to appearance; being different from both being and non-being (sky flower) it is really indescribable (*anirvacanīya*) in terms of the real and the unreal. Advaitism further explains that ignorance has two powers—the power of projecting the false (*Vikṣepa*) and the power of concealing (*Āvarana*) the real. As pointed out above, no absolutism can afford to ignore the importance of a theory of ignorance, because without that there can be neither an explanation for appearance nor any logical ground to reject appearance as false. In this regard Neoplatonism falls short of Advaitism.

There is yet another point to be considered. Śaṅkara starts with an analysis of illusion (*adhyāsa*) and on that basis comes to the conclusion that what is sublated (*bādhita*) is false and what is not sublated (*abādhita*) is real. In the rope-snake example the snake is sublated and the rope is not sublated. But in principle, the rope too or all that appears like snake is likely to be sublated. So the question arises: Is the world also sublated

anytime and is there anything which is never sublated? Reason alone can neither assert that the world is sublated nor that there is something which is never sublated. Here *śruti* or scripture comes to our rescue and tells us that *Brahman* or *Ātman* can never be sublated (*Trikālābādhita*) and that the world is sublated when *Brahman* is known. So *śruti* seems to be indispensable. But does Plotinus depend on *śruti*? Apparently he seems to depend only on dialectic which is the process of going up from the sensible world to the One—though the principles of dialectic are given to a receptive man by *Noûs*, yet Plotinus admits that someone is needed to show him the way.<sup>13</sup> We know that Plotinus had a Guru or teacher called Ammonius Saccas and so in the case of Plotinus the Guru takes the place of *śruti* or scripture. The *Upaniṣads* very clearly tell us that he alone knows who has a teacher (*Ācāryavān puruṣo veda*).

So we come to the conclusion that Neoplatonism has to be regarded as an absolutism of the Advaitic type. The two systems share most of the essential features of absolutism, though Advaitism does so more. There seems to be a kind of incompleteness in Neoplatonism. Our comparison does not intend to suggest that Neoplatonism was actually influenced by Upaniṣadic thought, though the possibility is not ruled out as held by some scholars.

## The Concept of Human Estrangement in Plotinism and Śamkara Vedānta

---

Ramakant Sinari

*Indian Institute of Technology  
Bombay, India*

The unique characteristic of different transcendence theories in philosophy is that they have emerged out of man's basic feeling of being placed in a world whose affairs are unable to contain his aspirations totally. For all purposes this feeling has remained the pivot around which transcendentalists have woven their thoughts. There is something indemonstrable and yet existentially certain about this feeling: it underlies all our preoccupations with objects and situations in the world. The awareness that the everyday world is the world of contingents and finites and represents only the surface of Being might not dawn on everybody with equal intensity. People take time to realise that our life conceals a kind of ontological separation of ourselves from our "roots," that this separation has made us perpetual seekers of quietude and security, that it is behind our most unpredictable moods of restlessness, boredom, dejection, anguish, and insignificance. The main program of transcendence philosophies is to ratiocinate and articulate this separation and sometimes to develop a salvation ethics that is supposed to rise from it. Plotinus's Neoplatonism and Śamkara's Advaita

Vedānta, two of the most comprehensive transcendental philosophies in the world, are aimed at both these ends. Their thrust is to speculate on the condition of the "fallen" man—man estranged from Being, from that hidden oceanic expanse within him that seems to be the *raison d'être* of all his experiences—and show the way for his self-recovery.

The Hellenic tradition, like the Hindu-Buddhist tradition in the ancient Orient, accentuated the ontological as against the empirical in man. It visualised man as an open-ended act yearning to encompass the meaning of all existence. For instance, Heraclitus (500 B.C.) speaks of Logos or the rational principle running through the universe, and about man as a being destined "to understand the intelligence by which all things are steered through all things." Man's spirit, he held, is open toward the Logos. For Parmenides, the junior contemporary of Heraclitus, the ontological ground of everything is Being and it is comprehensible through rational thought. Being, he said, is the One, changeless, undifferentiated, united, and inclusive of all that is. Pure thought points at it. It transcends the world of our sense experiences. To Anaxagoras, who figured *circa* 480 B.C., mind is the motivating force behind the whole world-process and must be referred to as the very device that enables us to construct our world-experience. Anaxagoras condemns the "weakness of the sense-perceptions" which prevent us from reaching the truth.

The principal design of the thinkers of the *Upanisads* (the source books of Indian thought, the oldest of which might have been composed *circa* 1000 B.C.) was to capture the transphenomenal foundation of our being in the world and to map out the entire urge for transcendence we feel while we are still submerged in worldliness. The polarity between the transphenomenal and the phenomenal, the transcendental and the immanent, or the eternal and the temporary, is the central theme of Upanisadic thought. Man's ordinary, empirical life (called *Jiva*) to which the world is real is looked upon by the Upanisadic sages as transitory, laden with ignorance (*avidyā*), illusory, and subject to suffering and evil. Our constant

endeavor is to reach the infinite, the eternal, the qualityless, the timeless. Our thirst is for the beyond, the most comprehensive, the wholesome, and until we are able to touch it our feeling of being estranged from what we ideally are is inevitable.

In Greek philosophy, as in ancient Indian philosophies, theories center around the transcendental-immanent horizons of human consciousness. They embody a certain attitude the attitude of rejecting the empirically given with a view to encompassing the essential or transphenomenal. Actually, if one limits one's interests to the world of objects and stays rigidly adhered to the phenomenal, one is likely to forever overlook the most natural inward-seeing act of one's consciousness. As Heidegger pointedly says, one's attention must slowly move from one's condition in the world to one's specific way of transcending this condition in the realization of Being.<sup>1</sup> The philosophies—empiricism, positivism, etc.—that today embody the assumption that a flight from the phenomenal toward the transphenomenal is arbitrary remain markedly unconcerned about the basic quest of the human self. For the recognition of this quest a reference to that which transcends the given, that is, to that which is incomprehensible through scientific thought and language, must be accepted as legitimate. Transcendentalists everywhere have repudiated the ability of the phenomenal to contain the movement of consciousness toward Being, i.e., toward its own basis.

Plotinus's (205-270 A.D.) conception of the transcendence-immanence nexus human consciousness reflects is highly representative of the Being theories that went before him. The single forceful idea which runs through all his six *Enneads* is that although the transcendental or "divine" realm (the One) is the true home of man, the spatio-temporal and practical world in which man (the All-Soul) lives is not unreal but a necessary completion of the One. The first emanation of the One is Nous. Nous is the eternal creative principle, the Divine Mind, the intellectual universe. It is the total and universal mind-stuff having a potentiality of diversifying itself into

multiple intelligences, which we ourselves are. Man as a sensible and self-conscious being is not cut off from Nous (or, for that matter, from Divinity), but as one possessing and having concern for his body and living amidst material things is lower than his transcendental source.

The One or Divinity is pure spontaneity and includes within its compass of self-expression everything that is or can be. It is manifest in man through his self-experience, i.e., through his experience of inner space into which his whole being runs as it were. Kierkegaard, the modern existentialist, refers to the One as the experience of "passionate inwardness" or "pure subjectivity." In fact the notable feeling we have of being uncompromised with the world or with ourselves speaks of our being away from the One. The One is the ontological self that we really are. There could be no estrangement, no sense of being fallen apart, had we not been born with a self that extends into the region of the absolute, the transphenomenal, the qualityless. The One is there already in us, but we have to realize it in order *to be* it.

The One, according to Plotinus, comprises three hypostases or principles: Itself or the Good, the Nous, and the All-Soul or Soul of the All. Two rather intricately conceived distinctions occur repeatedly in Plotinus's writings: the distinction between the One and the Nous and that between the Nous and the individual souls (the All-Soul). In fact there is no justification for the distinction he so ardently draws between the One and the Nous, for both these notions denote the organic totality of all that is. The One, Plotinus says, is pure will, pure unity, absolute love, and the cause and ground of all being.<sup>2</sup> Being Divinity itself, it is self-directed, self-loving, eternally creating itself, and returning upon itself. It is the Good, "light above light," "the active First Cause," the Absolute, the denial of all limitations, "the Infinite Self," the supreme source of all substances.<sup>3</sup> Plotinus, however, argues that the One does not by itself come within the reach of human knowledge. There is a certain distance between what

the human self is capable of "seeing" through the transcendental act and what it is as it is in the world. The One is not accessible to us directly—it is reached by us through the Nous, which is the transphenomenal essence of our consciousness.

The Nous (also described by Plotinus as the Intellectual Cosmos) is a bridge between man and the One. There is no way for man's ascent to the One except through self-knowledge and self-transformation. Being of the nature of the deepest experience our consciousness is capable of, Nous is the destination of our inward-seeing act.<sup>4</sup> Within our subjectivity we are much more than *what* we figure in the empirical world. As Nous we are the totality of all realizable mental powers. Human souls, Plotinus points out, are an emanation of Nous, which is the genesis of all that is good, beautiful, and intelligent in them.

In many sections of the *Enneads*, as A. H. Armstrong tells us, Plotinus describes the One in terms almost identical with those applied to Nous.<sup>5</sup> Both are characterized, for example, as the ground of all beings, the origin and totality of things, the unpredicable unity. Indeed here and there Plotinus emphasizes the purely noetic aspect of the One and accounts for Nous's being the primal stage in the emergence of the universe from God. In Nous, he remarks, the One finds its complete "radiation." It descends into the organic universal whole through Nous.

In any case, the One of Plotinus is the ultimate divine reality divisible into two—the Universal Mind and that which holds itself beyond it. The latter is of the nature of perfect transcendence, the One itself, or pure spirit hiding the potency of variegated mental and material creations. Generally, Neoplatonists, following the Pythagorean-Platonic tradition, allude to this, "the Highest of the high," as Infinite Dyad.

Plotinus's speculations on the condition of man in the world are not without ambiguity. Although the world and human souls in it are inherent to the Nous, the very world-experience (with its vicissitudes, contradictions, finitude, and

contingency) represents man's estrangement from his ontological home. Plotinus asserts that our being situated in time and space is not without the process of the One. The world has no explanation except in terms of the logic of Divinity's self-manifestation. And yet so long as the human soul dwells in the world it experiences a state of uprootedness. The ontological in man, the divine spirit flowing toward itself *via* him so to say, keeps him summoned perpetually. Nous's elusive call in him lifts him above his worldly engagements. In the face of worldly happenings, therefore, man lives a restless life.

There is a striking similarity between Plotinus's understanding of man's relation to the Nous and Śaṅkara's<sup>6</sup> theory of the bondage of human consciousness. Śaṅkara, like Plotinus, is an explorer of the ontological domain of human existence, and what he produces is an intellectual system as firmly based on the self's experience of transcendence as Plotinus's is.

Śaṅkara's mission was to realise the ultimate meaning of human existence. As an interpreter and reconstructor of the metaphysical thought of the *Upanisads* Śaṅkara was indeed committed to the ethics of salvation (*mokṣa*) which is the very backbone of the Upanisadic compositions. However when we examine the whole structure of his philosophy we see that it hinges on one profound observation, viz., that amidst everything that consciousness knows and does not know, or can know and cannot know, it has the peculiar characteristic of acting as a transphenomenal seer-into-itself. This characteristic which Śaṅkara has described by the word *ātman* (pure consciousness), or more appropriately *sākṣin* (witnessing consciousness), constitutes the principal ontological assumption of his system. Like Plotinus's Nous-All-Soul relation, Śaṅkara's *Brahman-ātman* (Being-self) relation is resolvable into a kind of two-faces-of-the-same-coin theory.

In Śaṅkara Vedānta, as in Plotinism, Being or *Brahman* is defined as the totality of all things, the ultimate basis of all strata of experience, the highest fusion of truth, knowledge, and eternity. There is nothing that does not depend on

*Brahman* or has not come out of it. It is the supreme intellect governing all phenomena. Intelligence, matter, space, time, causality, change, and all those categories through which we discern the reality of the world have their origin in *Brahman*.

The *Upanisads* say that the nature of *Brahman* cannot be exactly defined. They often use negative terms to convey what *Brahman*-experience could possibly amount to. Even contradictory attributes are ascribed to it. The *Bṛhadāraṇyaka Upaniṣad* states that it is like "light and no light, desire and absence of desire, anger and absence of anger, righteousness and absence of righteousness."<sup>7</sup> In the *Kātha Upaniṣad*, it is characterized as "smaller than the small, greater than the great, sitting and yet moving, lying and yet going everywhere."<sup>8</sup> Like the One or Nous in Neoplatonism, *Brahman* is taken both by the *Upanisads* and Śaṅkara as Supreme Spirit or Pure Essence, self-expressing, self-shining, and self-validating.

Śaṅkara's transcendentalism is ostensibly world-rejecting. By positing the Supreme Being (*Brahman*) as the ultimate cause of all existence, a life-force capable of manifesting itself through diverse products, Śaṅkara annuls the very reality of the world. Although everything emanates from *Brahman*, he argues, *Brahman* is not tied to its emanation. Like Plotinus's Divinity it is wholesome and creative because its presence is felt through all creation. Śaṅkara says that the universe has appeared as the effect of something which is absolutely real (*satyam*), eternally conscious (*jñānam*), and infinite (*anantam Brahman*). The universe is a variegated pattern and cannot have originated from a cause which is not absolutely perfect and self-caused. This self-caused cause, viz., *Brahman*, Śaṅkara asserts, expresses itself through an infinite number of things (*nāma-rupa*) all of which are appearances. Thus the universe, compared to the primordial reality of *Brahman*, is an appearance.

What Plotinus states about the One or the absolute is almost an echo of Śaṅkara's understanding of *Brahman*. Plotinus writes:

...in the One itself there is complete identity of knower and known, no distinction existing between being and knowing, contemplation and its object constituting a living thing....

...Being is limitless; in all the overflow from it there is no lessening either in its emanation nor in itself....

Its nature is that nothing can be affirmed of it—not existence, not essence, not life—It transcends all these.<sup>9</sup>

Both Plotinus and Śaṅkara argue that the Real at the heart of the universe is reflected in the depth of the human soul. This depth is denoted by Śaṅkara, following the Upaniṣadic insight, by the word *ātman*. Insofar as their ontological aspect is concerned, there is no distinction between *Brahman* and *ātman* just as there is none between *Nous* and the individual souls. *Ātman* is only an individuation or a kind of reflection of *Brahman* in man. Throughout Indian philosophy the identity between *Brahman* and *ātman* is presumed.

However, although *Brahman* as the Supreme Being and *ātman* as the individual self are not fundamentally distinct from each other, to every individual his own empirical existence is a unique fact. In its essence *ātman* is of the nature of highly intuitive knowledge, pure consciousness, total transcendence, but in its worldly state it finds itself to be a stranger, that is, to have lost its self-identity. *Ātman*'s whole endeavor is to realise its own being which is somehow lost.

According to Śaṅkara, our phenomenal or *vyāvahārika* existence represents our estrangement from our original transcendental or *pāramārthika* state. The standpoint to which we are accustomed in our ordinary life does not originate from our transcendental being but from a misleading and deluding agency, called *avidyā* or ignorance, operating in us. *Avidyā* inauthenticates *Brahman* or *ātman* and reduces it from the transphenomenal to the phenomenal tier. As individuals on

the phenomenal tier, that is, as souls overwhelmed by the affairs of the world or *samsāra*, we live a life of homelessness, dereliction, and ennui.

Actually there is no problem of estrangement unless one is aware that one has fallen out of a reality to which one ought to be harmoniously related. Man would not have been enveloped by loneliness had he been in unison with his inner space. As Heidegger says, all our attitudes toward things in life are colored with a kind of "homesickness."<sup>10</sup> We seem to have run asunder from our native land, the ontological source of our existence, and descended deep into the crevice of temporality. The estranged constantly moves along a passage between a state of forlornness and the imperative I-should-be-my-real-self. The most striking characteristic of our worldly self is that it feels that it lives a fractured existence and that it is in quest of a state of being unlike anything that it can experience on the phenomenal plane.

What is peculiar and undoubtedly paradoxical about human consciousness is that it is phenomenal and transphenomenal at the same time. Plotinus underlines this paradox throughout his reflections on the *Nous-All-Soul* relationship. He does not reject the vividness of the experience we have of living as "bodied" and in a material world, the sense-world is existent, engaging, and inescapable. But compared to the transphenomenal world, that is, the world of the One or *Brahman*, this world is a confinement. In Indian philosophy it is described as bondage; Plotinus suggests that it is like a prison or cave.<sup>11</sup> Man lives in this world like a stranger, an alien. Although we are born in a physical, spatio-temporal universe and are endowed with empirical consciousness, we are not completely bound up to it. It is because man is ontologically higher than what he is "condemned" to be in the world that he feels forlorn.

For Śaṅkara the self or *ātman* is worldly and trans-worldly, *saguna* (having qualities) and *nirguna* (qualityless) at one and the same time.<sup>12</sup> The two antithetical attributes of the human self respond to two distinct points of view. Understood as the

innermost subjectivity perceived from within, the *ātman*-experience constitutes a domain about which it is impossible to make logical statements. The indubitable truth, Śaṅkara says, is that the pure and self-luminous *ātman* is not grasped by our rational thought but by the suprarational insight inherent in us. Our world-consciousness, on the other hand, is the mundane aspect of our existence. In the whole Vedānta tradition, man as a being conscious of the world is described as *jīva*. *Jīva* is thus the condemned form of *ātman*, i.e., *ātman*'s inauthenticity and self-estrangement shows up in *jīva*. Śaṅkara looks upon *jīva* (literally, soul) as pure consciousness under the spell of a kind of self-deception or ignorance (*avidyā*).

Plotinus is not a total world-rejecter, at least not to the extent of dismissing the world impressions we have as unreal. Having mastered the paths trodden by Plato and Aristotle before him, he makes a compromise between two apparently unresolvable positions, viz., "transcendence alone is true" and "the source of all that is essential or formal is to be bound in particulars." For Plotinus human souls are born in the world as "bodied" because of their original proneness to sin, fall, or degradation. The world, however, is not their permanent abode. Plotinus writes:

This is the fall of the soul, this entry into matter; thence its weakness; not all the faculties of its being retain free play, for matter hinders their manifestation; it encroaches upon the soul's territory and, as it were, crushes the soul back and turns to evil what it has stolen until that finds strength to rise again.<sup>13</sup>

There is almost a reverberation of the theory of the Nous-All-Soul hypostases in Śaṅkara's idea of the transcendental-empirical aspects of *ātman*. According to Plotinus, the Nous is not a unidirectional and finished reality but a sort of going-out-of-itself and turning-within-itself act. That is why individual human souls, despite their being concerned about the

world ordinarily, find themselves as acts of will thrusting ahead. By their very ontological make-up they exhibit a thirst for eternity, a longing for Being, an urge for de-estrangement. The nature of human soul, Plotinus explains,

is twofold, being of divine station but skirting the sense-known nature; thus, while it communicates to this realm something of its own store, it absorbs in turn whenever it plunges in an excessive zeal to the very midst of this sphere; though even thus it is always able to recover itself by turning to account the experience of what it has seen and suffered here, learning so the greatness of existence in the Supreme and more clearly discerning the finer things by contrast with their opposites. The experience of evil brings the clearer perception of good.<sup>14</sup>

Thus for Plotinus and Śaṅkara man is born with a call from the Absolute, the Nous, the Divine, or *Brahman*. The ontological in us transmits this call. By functioning in the world man does not really sink into self-oblivion. The quest for the transphenomenal forms the core of his life's activities. Human consciousness is a whole and does not permit of a permanent cleavage within itself. The transcendental and the phenomenal, the *pāramārthika* and the *vyāvahārika*, the *ātman* and the *jīva* are therefore facets or dimensions of the same integral reality, the same human soul.

The progression from the empirical to the transcendental is a process within the realm of one's own consciousness. It is a journey from one's experience of the solidly existent world, i.e., the world of static externals, to the world of one's own "inside." In fact in every state or act of our mind we surpass ourselves as outer-directed beings and "flow" inward toward what can be described as the pre-reflective and pre-conscious expanse. This expanse is not fully verbalizable. Because of its immensely elusive and metalinguistic nature the *Upaniṣads* have used negative epithets to denote it. The Buddhists

equated it with Emptiness (*śūnyatā*). Buddhists very significantly emphasize its holistic, subjective, and existential realization by one in one's own inner space—that is, one intuitively it as “oneness of being and non-being.”<sup>15</sup> Plotinus and Śaṅkara do not overtly stretch their negative characterization of Being to the extent of emptying it out, but still their repeated suggestion that it is unpredicable and unverbalizable takes it close to Buddhists' Nothing. Consciousness' transcendence is ultimately the indication of the invitation Being exercises on it.

There is perhaps no other expression of human reality which is as mysterious as its being in the world and being at the same time a project beyond the world. Man is a self-surpassing movement, a perpetual act of being and non-being, a highly ambiguous oscillation between the phenomenal and the transphenomenal. Nothing posits itself as stable and finished to human consciousness. We “fly” over the realized freedom, beyond the fulfilled state of our being, and beyond all that we are in *this* world. A continuous state of awakening to the primordial foundation of our existence, that is, to our ontological roots as it were, leaves us with a feeling of being self-estranged. The story of man is the story of his endeavor to overcome this feeling.

#### NOTES

1. For Heidegger, man hides the possibility of reaching his ontological basis, viz., Being. See Arne Naess's study of Heidegger in his *Four Modern Philosophers* (Chicago: The University of Chicago Press, 1968).

**Plotinus and  
Śrī Aurobindo:  
A Comparative Study**

---

Pritibhushan Chatterji

*Calcutta University  
Calcutta, India*

I

Ever since the dim dawn of speculation man has been inquiring into the nature of this universe and his place therein. He has been raising and discussing the questions: How came this universe into existence? Whence are we? Whither are we? Man's curiosity about the *how*, the *whence* and the *whither* gave rise to science and philosophy. In the early stage of human thought science and philosophy were inseparable, but gradually science separated itself from philosophy and kept itself confined to sense-experience. But philosophers, at least many of them, preferred to transcend the empirical world and raised questions about meta-empirical Reality. What is the nature of the Ultimate Reality? Is it one or many? Is it conscious or unconscious? How is the finite world—especially the world of selves—related to the Ultimate Reality? These are some of the perennial problems to the solution of which philosophers of different ages and climes have formulated different theories and world-views. Of course, some have

adopted a negative attitude and have denied the utility and even the validity of metaphysical questions. We are not concerned with them. We are here specially concerned with two great thinkers—Plotinus and Śrī Aurobindo—who, though separated by a gap of sixteen hundred years and long stretches of land, offered some constructive suggestions to the solution of the metaphysical problems of perennial interest. The two thinkers have different philosophical traditions and historical and cultural backgrounds. Plotinus was born in 205 A.D. in Upper Egypt and was probably a “Hellenised Egyptian,” whereas Śrī Aurobindo was born in India in 1872, educated in Britain according to the English pattern of schooling, and later on turned nationalist Indian and drank deeply of Indian lore.

In the present paper we devote ourselves to a comparative study of these two great thinkers.

## II

The philosophy of Plotinus is an integrated one. The entire classical Greek philosophy casts its shadow upon his philosophy. He develops a full-fledged theory of the One in the Platonic tradition. He is also influenced by Aristotle and the Stoics. But he does not simply combine Plato, Aristotle and the Stoics—his writings display the unity of the vision of the entire Greek philosophy. Much in the same way Śrī Aurobindo also formulates an integrated philosophy—a philosophy which effects an integration of the different types of philosophy, Indian and Western, ancient and modern, and yet bears a distinct stamp of originality.

These two master minds are concerned with the nature and character of the Ultimate Reality and of the relation of the world to it. Both of them believe in one Supreme spiritual Reality as the ultimate source of everything. While Plotinus owes his inspiration to Plato, Śrī Aurobindo owes his to the philosophy of the *Upaniṣads* as developed in the Vedānta. Śrī

Aurobindo characterizes the Supreme Reality as *Sat-Cit-Ānanda*, i.e., Existence-cum-Consciousness-cum-Bliss. Plotinus, however, does not describe the One in any such way, but it is implicit in his system that the One is existence-cum-consciousness, for it is the first principle of Being and the ultimate source of Intellect and souls. Plotinus points out that no adequate description of the One is possible, for human language is quite unfit for the task. Following the Upaniṣadic ideal Śrī Aurobindo also holds that the Supreme Reality is also beyond the grasp of human reason. Both Plotinus and Śrī Aurobindo agree that all things move out of the Supreme Reality and all finally move towards it.

## III

Before we take up a detailed comparative study let us have a brief survey of the philosophy of Plotinus.

Plotinus conceives of a Trinity which is constituted by three hypostases, viz., the One, the *Noûs* and the Soul.

The One is the first member of the Trinity. But how to prove it? The proof is provided by two doctrines formulated by Plotinus: (a) the doctrine of emanation, and (b) the doctrine of intuitive experience.

The entire world must have come out of some source. In so far as the world is one system, the source must be the *same*. Hence it may be presumed that the world is an emanation from some one higher principle. Moreover, the One is realized by many seers in their mystical experience. Though this experience is incommunicable, those that have it are convinced of its validity and they welcome others who would follow them. Indeed, the heart has “reason” which the logical intellect knows not of.

The primal One pervades the entire world-system and in this sense it is omnipresent. But the One is also other than everything that we experience in this world. As it is other than everything elsewhere, it is “nowhere,” i.e., not existing

in a particular point of space or in a particular thing. The One is unique and hence it cannot have any parallel or anything similar to it. It is infinite—it is the greatest and the highest, not quantitatively, but qualitatively. It is infinite, not because it cannot be counted or measured, but because it eludes all attempts at comprehension. It is the greatest, not because it has the highest degree of magnitude, but because it has the highest potentiality. It is the highest, not because it has the greatest height, but because we cannot imagine anything higher than this. It is also the highest Good, because it is above all goods. There is no earthly good to which it is subordinate or which it tries to acquire by effort. It does not aspire after anything, but all things aspire after it. Instead of the One becoming good in association with others, those others that participate in it become good. It is free, because nothing can conceal its self-manifestation.

The One produces the *Noûs* (which is rather imperfectly translated as "Mind" or "Intellect"), and the *Noûs* in its turn produces the World-soul or Soul of the Whole. This third principle is directly responsible for the production of all earthly existents. This sort of serial production is to be understood as the preceding member of the series delegating its potentiality to the succeeding member. As Whittaker explains, "As mind looks back to the One, Soul looks back to the Mind and this looking back is identical with the process of generation."<sup>1</sup> It should, however, be borne in mind that this order of first, second and third principles is to be taken neither in the spatial nor in the temporal sense; but their priority and posteriority is to be understood in the logical sense.

But why should the One indulge in Creation at all? Plotinus replies that since the One contains the potency for all, it cannot but manifest itself, for potency without an express manifestation becomes meaningless. If there is sun, there must be light; similarly, if the One is, then the *Noûs* as its manifestation must be. As the sun is to the light, so is the One to the *Noûs*. The One has its eternal "irradiation" in the form of the

*Noûs*.<sup>2</sup> Just as man becomes conscious of himself through self-consciousness, so the One may be said to "see" itself through the light of the *Noûs*.<sup>3</sup> The One is prior to all thought and Being, and so it requires something, viz., *Noûs*, that would manifest it, and through that it becomes conscious. But in itself it is not unconscious or subconscious—rather it goes beyond consciousness. It must however possess potentiality for consciousness which finds expression in *Noûs*. Indeed, the One is inexpressible and it is difficult to characterize it.

The *Noûs* may be described as Supramundane Intelligence. Emanating as it does from the One, it contains the potentiality for all existence. This potentiality indicates that it has the productive capacity by which the essential forms are made manifest in apparent separation from one another and from the One. Thus Plotinus leans towards the Platonic doctrine of appearance and reality. He holds after the manner of Plato that individuals are individuated not simply in terms of space and time, but are individuated as "appearances of Ideas which alone are real." So all individuals pre-exist in the *Noûs*. And this is true not only of man, but of all sub-human and vegetative life.

The third and final member of the Trinity is Soul. It possesses a twofold nature—one upward and the other downward. "It is," as Dean Inge explains, "an energy thrown off by the Spirit. As an image of Spirit, it resembles its principle closely. But while on one side it is closely attached to Spirit, of which it is the effluence, on the other it touches the phenomenal world. Soul is still a part of the Divine world, though the lowest part."<sup>4</sup> In other words, in its transcendent aspect or upward movement it is related to the *Noûs* (Spirit, Mind or Intelligence) and in its downward aspect it functions as a principle of life and growth.<sup>5</sup> The Soul is in fact the so-called "connecting link" between the spiritual world and the phenomenal world—it is the "last logos of the former and the first element of the latter." Because of its connection with the phenomenal world there may be two kinds of

misunderstanding, viz., that it is limited and that it is lost in the world. Plotinus rules out both these objections. He says that the Soul being rooted in Noûs cannot be limited—rather it is capable of unlimited expansion. Again, the Soul is not lost or merged in the world, rather the universe participates in it and is “embraced and moulded” by it. The Soul is the Providence ruling over the world, and hence the material universe becomes a living organic whole. The Soul is not the aggregate of particular souls, rather it is the Soul of the All. It is not just at the summit of the world and it has no fixed position—it is, to quote Inge again, “the wanderer of the metaphysical world.”<sup>6</sup>

The Soul which is the World-Soul or Soul of the All gives rise to individual souls. Plotinus finds it difficult to explain how the World-Soul originates the individual souls; but he would not accept the view that there is *one* Soul, a view which is subscribed to by Heraclitus and the Stoics. The individual souls have their places in this world. An individual soul descends into a body. For Plotinus this descent is a kind of fall and yet is a kind of necessity. It is both voluntary and non-voluntary. The soul suffers from self-isolation and because of this it is imprisoned in a body. This descent does not mean that a soul literally moves down into body. The descent happens when a body shares in the life of a soul. The “sharing in” or participation of the body in the soul becomes an evil, as the universal activity of the soul is thereby hampered or limited. The soul as it descends “leaps out,” so to speak, from the whole to a part and is thus compelled to confine its activity to a part.<sup>7</sup>

The imprisonment of the soul in a body is not permanent. It has the capacity for rising to the One. The return of the soul to the One is obviously not visible, tangible or physical in any sense. The return is psychical. It involves (a) mentally withdrawing oneself from the world and thereby interiorizing oneself, (b) undergoing a rigorous intellectual and moral discipline, and (c) realizing the internal illumination and union with the One. The re-discovery of an individual's true self is

in the first instance a return to Noûs. Then as he feels himself as “perfect in wisdom and goodness,” he feels himself united with the One. The individual then comes to the journey's end. It is extremely difficult to describe this stage of union. But probably Plotinus does not mean that an individual is completely lost and merged in the final stage of union. Armstrong holds that it will be a stage of unity-in-diversity. He comments: “It is true that in the union we rise above Noûs to a state in which there is no longer Seer and Seen, but only unity. But universal Noûs, of which we are then a part, exists continually in that state of union without prejudice to its intuitive thought and unity-in-diversity.”<sup>8</sup>

The ethical duty of an individual is to make an attempt to overcome the limitations arising out of its imprisonment in the body and be united with the One, from which, metaphysically speaking, the world has descended. Thus ethics requires an individual to move in a direction opposite to that in which the world has evolved. As Windelband explains, “Metaphysics and ethics to Plotinus were, then, in inverted parallelism: ethics teaches the way of salvation to be the same series of stages of development toward an end, which is known in metaphysics as the process of origination from a beginning.”<sup>9</sup>

#### IV

Let us now turn to Śrī Aurobindo. Like Plotinus Śrī Aurobindo also is a monist and he also starts from the concept of one Supreme Being. Plotinus seems to lean, at least occasionally, towards rigid monism and reminds one of the Advaita philosophy (which is a purely absolutistic or non-dualistic philosophy), advocated by Śaṅkara and others. Śrī Aurobindo supports a kind of modified monism, which he calls integralism. While Plotinus is content with stating that the One contains the potency for all existence and is inexpressible, Śrī Aurobindo accepts an integral view of Reality and tells us that Reality is neither pure one nor many, but is a unity in

diversity and at once personal and impersonal. To quote him, "The absolute reality of the Absolute must be, not a rigid indeterminable oneness, not an infinity vacant of all that is not a pure existence. . . ." <sup>10</sup> As pointed out at the outset, Śrī Aurobindo characterizes the Supreme Reality as *Sat-Cit-Ānanda*, i.e., Existence-Consciousness-Bliss. It is a triune Being. The triple nature does not again mean the existence of three separate attributes. That which is Existence is Consciousness, and that which is Consciousness is Bliss. The Reality is basically consciousness and it contains within itself Spiritual Energy, which, when manifested, becomes active and dynamic force, i.e., Creative Energy. Hence Śrī Aurobindo prefers to speak of Consciousness-Force in a hyphenated form with reference to the Supreme Reality. This stress on consciousness and dynamic energy seems to be lacking in Plotinus.

Neither Plotinus nor Śrī Aurobindo keeps the Supreme Reality confined to itself. Both of them explain the world as a product of the One Supreme Reality. The key concept with Plotinus is "emanation," while with Śrī Aurobindo it is "evolution." Plotinus thinks that the *Noûs* emanates out of the One and the Soul out of the *Noûs*. But the term "emanation" does not carry with it a sense of activism on the part of the One—it seems to imply that the world-system automatically comes out of the One, its nature being what it is. But here Śrī Aurobindo falls back on the concept of evolution, which is a dynamic concept. He also puts his own interpretation upon it. The supporters of the traditional mechanical theory of evolution hold that matter gives rise to life and life to mind. But they cannot explain how and why matter should lead to life and life to mind. They cannot satisfactorily explain the *nisus* of evolution, feels Śrī Aurobindo. To explain the onward movement of evolution Śrī Aurobindo formulates a somewhat novel concept of *involution*. He tells us that evolution has been possible because there has been a prior involution. *Saccidānanda*, the Supreme Reality, veiled itself voluntarily and came down to a level which is called the level

of matter. Thus what passes for matter is not really dead, inert matter, but supreme consciousness in a *veiled* form. Evolution is therefore not a mere change, a result of chance variations, an operation of matter-particles, but it is guided all through by Consciousness-Force. Consciousness which is veiled in matter struggles for expression. In animal life this consciousness manifests itself in a rudimentary form in instinct which is subconscious or just conscious. Consciousness moves further, though slowly and gradually, through more and more organized forms of life; and it reaches a highly complex form in Man. While the emanation of Plotinus is a three-stage process, the evolution of Śrī Aurobindo's conception is a six-stage process. According to Śrī Aurobindo, the progressive movement of evolution passes through the following stages: (i) matter (*jada*); (ii) life (*prāṇa*); (iii) psyche (*caitanya-puruṣa*); (iv) mind (*manas*); (v) super-mind (*vijñāna* or *Rta-ctr*); and (vi) Existence (*sat*). This evolution takes place because it was preceded by involution. Involution passed through the above stages in the *reverse* order. This means that Supreme Being or Existence first came down to the level of Supermind, then to the level of mind and so on gradually, stopping at the level of matter. Thus what Plotinus calls emanation has some resemblance with Śrī Aurobindo's concept of involution. But emanation is directly involved in creation, while involution is a pre-condition of evolution which is involved in creation.

Both Plotinus and Śrī Aurobindo agree in holding that matter cannot have any separate existence over against the Spiritual Reality, and both are opposed to any gross dualism between Spirit and matter. But their attitude to matter is different. For Plotinus matter is indeterminate and is in its nature ugly and evil. It is at the opposite extreme of things intelligible. Just as light gradually fades away in darkness, so the divine essence gradually degenerates and loses itself at the farthest end into matter. Thus matter is a non-being, a principle of negation. But for Śrī Aurobindo matter is nothing but

Supreme Reality in a completely veiled form and not something in which Reality degenerates and loses itself completely. Indeed, for Śrī Aurobindo matter is concealed consciousness and hence emergence or creation is possible from the side of matter (which, of course, is really spirit). For Śrī Aurobindo, matter, being Supreme Reality in a veiled form, contains all the potentiality for creation, while for Plotinus the potentiality of the One terminates or disappears in matter. Unlike Plotinus, Śrī Aurobindo would not call matter an evil, though of course he characterizes it as a "seat of ignorance" in so far as the light of consciousness remains concealed in it. In short, the attitude of Plotinus to matter is more negative than positive, while that of Śrī Aurobindo is more positive than negative.

Both Plotinus and Śrī Aurobindo look upon the universe as a harmonious whole, as an unbroken series of descending and ascending values and existences. For Plotinus all grades of existence are, says Dean Inge, "integral parts of the eternal systole and diastole in which the life of the universe consists, a life in which there is nothing arbitrary or irregular."<sup>11</sup> And the remark applies equally to Śrī Aurobindo. In fact, in both Plotinus and Śrī Aurobindo the concepts of Descent and Ascent figure prominently.

Though both Plotinus and Śrī Aurobindo speak of descent and ascent, their interpretation varies. With Plotinus the descent starts with emanation from the One; and the One cannot but emanate because of its inherent potency. He does not tell us *why* the One should emanate. But Śrī Aurobindo seems to be more explicit on this point. He holds that the Supreme Reality descends or conceals himself voluntarily in order that there may be ascent, evolution or creation. The two processes of Descent and Ascent, Involution and Evolution, are always going on—they constitute the cycle of cosmic existence and thus they bring to the forefront the problem of the *how* and the *why* of Existence. The Supreme Reality indulges in involution or descent in a sportive spirit (or *līlā*, as it is technically called) for the delight of becoming. Thus with

Śrī Aurobindo descent and ascent are twin processes that go hand in hand and one is a correlate to the other. But in Plotinus, as we have seen, the notion of descent in the sense of voluntary concealment on the part of the One and for the sake of cosmic emergence or creation is lacking. When Plotinus comes to the third member of his Trinity, viz., Soul, he speaks of descent more or less in the sense of fall or degeneration. The Individual Soul falls into a body, and in order to overcome the bad company of the body, the soul should strive to make an ascent. The soul of an individual, even though imprisoned in a body, maintains a separateness from the body, which as material is an "evil." But when Śrī Aurobindo advises spiritual ascent of an individual, he does not advise anyone to leave aside the body. Śrī Aurobindo aims at *total* perfection through total transformation, a divinization of the entire earthly life. Hence he cannot ignore the body which constitutes "the base" of our life on earth. If we can rise to the Spiritual height, the base should also join the heights. Says Śrī Aurobindo, "If our seeking is for a total perfection of the being, the physical part of it cannot be left aside; for the body is the material basis, the body is the instrument which we have to use."<sup>12</sup> The spiritual transformation on which Śrī Aurobindo lays so much emphasis "is *not* a change into something purely subtle and spiritual to which Matter is in its nature repugnant and by which it is felt as an obstacle . . . ; it takes up Matter as a form of the Spirit. . . ."<sup>13</sup> In divine transfiguration the physical body of a man will shine, assures Śrī Aurobindo, in the glories of "a pure and spiritualized physical existence."<sup>14</sup> From this it is evident that Śrī Aurobindo is averse to any total condemnation of earthly life in bodily form. In fact, the *leitmotiv* of Śrī Aurobindo finds expression in the two fundamental questions which he discusses: (a) How can divine life be established on earth?; and (b) How can Spirit be reconciled to Matter? Hence there cannot be any attempt on the part of Śrī Aurobindo to run away from earthly life.

It should also be noted that when Śrī Aurobindo speaks of the ascent of an individual, he also points out that individual evolution is in tune with cosmic evolution. Ascent and Descent constitute the very feature of the cosmos itself. Of Plotinus it has been said that he is "caught between a cosmos-centered and man-centered perspective."<sup>15</sup> But Śrī Aurobindo tries to effect a reconciliation between these two perspectives.

Both Plotinus and Śrī Aurobindo agree that the ascent of an individual to the supreme level is a long and arduous process and that when an individual rises to the spiritual summit he experiences a supra-terrestrial illumination. According to Plotinus, an individual soul first rises to the *Noûs* and therefrom to the level of the One and finally becomes united with the One. At this supreme level an individual has a kind of Vision that baffles all description. Plotinus says, "To see and to have seen that Vision is reason no longer. It is more than reason, before reason, and after reason. . . ."<sup>16</sup> Similarly, according to Śrī Aurobindo, to have supramental transformation an individual has to undergo a psychic and spiritual transformation. He also describes that there are four stages of ascent from the level of human intelligence to that of the Supermind, viz., (i) Higher Mind, (ii) Illumined Mind, (iii) Intuitive Mind, and (iv) Overmind.<sup>17</sup> When an individual reaches the goal of Supermind, his body and mind undergo a radical transformation and he becomes a gnostic being. A gnostic being has a vision of Truth and he develops an integral knowledge which transcends the ordinary level of argumentation or ratiocination. He also transcends all so-called values of our daily life. The whole of the gnostic life is governed by one principle of self-expression of the Spirit, the Will of the Divine Being. This principle leaves enough room for freedom and no rigid standardization is insisted upon. The Gnostic is not thus merged in the Supreme Reality. He experiences an ineffable joy and delight and his mind is always illumined. Śrī

Aurobindo visualizes the emergence of a community of gnostic beings or supermen and with its emergence the Kingdom of Heaven on earth will be established.

Unlike Plotinus, Śrī Aurobindo is not so much interested in the saving of an individual soul as he is in the upliftment of concrete man. For Śrī Aurobindo the emergence of man is not just an event among events—rather it is a central episode of the evolutionary world pregnant with immense significance. Man appears to be an ambiguous phenomenon—he is half-animal and half-god. He has a pre-human past and super-human future. He is in between the forces of Nature and Spirit. But this ambiguity is not, in the words of Śrī Aurobindo, "a thing to be deplored, but rather a privilege and a promise, for it opens out to us an immense vista of self-development and self-exceeding."<sup>18</sup> Man thus occupies a special position of honour in so far as he is destined to a higher life by unfolding the potentiality that lies dormant in him because of the involution of the Supreme Reality. Man is not the last word or the full stop in the evolutionary process. He is limited and yet he aspires to be infinite; he is relative and yet he feels an irresistible urge towards the Supreme. So man should transcend the level of humanity and develop the Superman in him. This is no determinisitic conception of development, for man must make genuine spiritual efforts to unfold his innate potentiality for a divine life. This ideal of supermanhood is to be carefully distinguished from the inflated ego of the physically strong man or the *Übermensch* of Nietzsche's dream. Such a superman is an apotheosis of mere power or physical strength who does not care at all for values and norms. But the Superman of Śrī Aurobindo's vision rises above the level of humanity not by physical power but by spiritual progress. He cares more for inner conquest than for outward show of power. He converts his whole being into "a channel of divine puissance." Needless to say, this conception of the Superman is lacking in Plotinus's conception of the ascent of the soul. Moreover, this conception puts a meaning in evolution by emphasizing the supreme end which is being

progressively realized through it. And this teleological meaning cannot be discovered in Plotinus's theory of emanation.

While formulating the ideal of Supermanhood Śrī Aurobindo tells us that individual effort by itself is not adequate for the development of Supermanhood and so the individual effort is to be combined with Divine Grace. Man can ascend, only if the Divine descends to lift up man. Thus a new meaning is added to the concept of Descent. The meaning is that unless the Divine Being condescends to descend and stretches out His helping hand, an individual man cannot ascend or rise to the supramental level all by himself.<sup>19</sup>

## V

We now come to the end of our brief comparative study. The purpose of this paper is surely not to extol or decry one of the two philosophers (whom we have compared) at the cost of the other. Such a study repays in so far as it shows how the two philosophers differing in their ages and philosophical training offered certain similar solutions when faced with more or less identical problems.

Each of the two thinkers we have studied here is an original thinker in his own right. And each is difficult to interpret. Every interpretation that may be offered is likely to be challenged by a counter-interpretation. But on the whole it seems that the philosophy of Plotinus is more abstract than concrete, while that of Śrī Aurobindo is more concrete than abstract. But they can meet in so far as they both trace the universe to One Reality and neither of them explains away the world of things and beings as an illusion. Moreover, neither of them is a purely abstract thinker, spinning cobwebs of theories; on the other hand, both are practical and intensely eager to offer relief to ailing mankind. Both philosophers feel that the destiny of an individual is not to be confined to the here and now. Both are of the opinion that

an individual should make a genuine effort at spiritual regeneration. Both seem to diagnose that we suffer so much because we have moved far away from our original spiritual home, and that the sooner we return to our spiritual home, the better. The last words said to have been uttered by Plotinus, "Try to bring back the god in you to the divine in the All,"<sup>20</sup> sum up as much the philosophy of Plotinus himself as of Śrī Aurobindo.

Civilization today is passing through a crisis and mankind is overburdened with maladies of existence. We simply develop a feeling of anguish, a kind of nausea, a sense of alienation in this world. We raise the problem of evil and suffering, but cannot throw any light thereon. We have freedom and yet we cannot fruitfully utilize that freedom, because we do not know what our duties are. We do not realize that our primal duty is to awaken the Spirit that lies dormant in us. If we follow the lead of thinkers like Plotinus and Śrī Aurobindo, we shall realize that human existence can never be cut off from its basic spiritual structure. It is time that we realize this, and if we are able to do so, we shall be able to solve the maladies of present-day human existence.

## The Influence of Indian Philosophy on Neoplatonism

C. L. Tripathi

University of Allahabad  
Allahabad, India

In the annals of comparative philosophy there has been a controversy among Orientalists regarding the influence of Indian philosophy on Neoplatonism. Both advocates of Indian influence on Neoplatonism and their opponents have adduced strong arguments to establish their theses. In order to resolve the controversy which, like Hydra, raises its head again and again, we have to answer three questions: (1) whether some doctrines are common to both Indian philosophy and Neoplatonism; (2) whether they are of Indian origin and involve abandonment of the Greek tradition of rational critical thought;<sup>1</sup> and (3) whether chronologically they first appeared in India or in Greece?

### I

As regards the first question a brief sketch of the fundamental doctrines of Neoplatonism with reference to their Indian parallels will be sufficient for our purpose.

*The One.* In the philosophy of Plotinus, the One is another name for God. It is the Absolute Spirit. It is pure being and the absolute causality. It is also the "Good." Everything finite finds its aim in it and flows back into it.<sup>2</sup> It has no attributes at all; it is a being without magnitude, without life, without thought. It excludes all knowledge; Plotinus says, "imagine a well (*pēgē*) without origin; it gives itself to all rivers; but it is not diminished by that; it remains quietly in itself."<sup>3</sup> It reminds us of the Absolute described in the peace chant of the Hindu *pūrṇam*, where plenitude proceeds from plenitude yet it remains plenitude undiminished and undisturbed.<sup>4</sup>

*Emanation (Creation).* The question arises: if there is no good beyond the Absolute why should the One create anything beyond itself? Plotinus answers that since all things, even those without life, impart of themselves what they can, the most perfect cannot remain in itself but must pass over. Hence, the creation is not something different from the Absolute. It is the overflow of the Absolute. He compares the Absolute with an overflowing spirit which by its excess gives rise to that which comes after it,<sup>5</sup> or a central source of light which illumines all things.<sup>6</sup> It may be compared with the Hindu concept of *Līlā*. The production of the lower is not the aim or the motive of the activity of the higher. Creation is not a physical process but emanation. The distinction is similar to that between *vivarta* (appearance) and modification (*pariṇāma*). Both Plotinus and the *Upaniṣads* hold that God does not disperse Himself in individual or natural things. There is a continual process from first to last, but the cause remains itself as it was.<sup>7</sup>

*Noûs.* The first emanation of the original essence is Noûs. It is a complete image of the original essence and archetype of all existing things. Mind knows its objects not like perception of external things, but as one with itself.<sup>8</sup> As this unity involves the duality of thinking and being thought, it is not the highest but the second in order of supermundane causes. It is being and thought at the same time. As image the Noûs is equal to the original essence, as derived it is completely

different from it. It is for Plotinus the highest sphere the human spirit can reach and at the same time pure thought itself. This doctrine of Noûs may be compared with the personal (*Saguna*) *Brahman* of the *Upaniṣads*.

*Soul.* The soul is an immaterial substance like Nous, its image and product. It is related to the Nous, as Nous is related to the primal One. It stands between the Nous and the world of phenomena. It is the principle of life and motion in things. It is of two kinds: the World Soul and the individual soul. The first can be compared with the doctrine of *Hiranyagarbha* of the *Upaniṣads* and the second with the *jīvātman*. Like the *Upaniṣads*, Plotinus maintains that the soul can return to itself through the practice of virtue and ascetic purification.

After release from the body the soul dwells in God which is reality and true being. It is a world which cannot be seen with our physical eyes.<sup>9</sup> Here we are no longer men, we are kings.

*Hyle.* Plotinus has described *ὕλη*, or "matter," in many ways. It is the same as evil, "privation," "a lie," a "phantom."<sup>10</sup> It is a mere abstraction, a name for the bare receptacle of forms. It is indeterminate nothing and yet not nothing. It can be compared with the doctrine of *māyā* which is appearance yet not a mere blank. It is something positive. In the words of Puech, it is magical and illusory. Being the product of matter this sensible world is also a mere illusion.<sup>11</sup>

*Rebirth.* Like the *Upaniṣads* Plotinus believes in the doctrine of rebirth. For him even animals have souls. So long as we do not attain the highest wisdom we are bound to successive rebirths, which are like one dream after another or sleep in different beds.<sup>12</sup>

*Law of Karma.* Plotinus believes in the Law of *Karma*. He says it is a universal principle that each soul after death goes where it longs to be.<sup>13</sup> Those who have exercised their human faculties are born as men; those who have lived a sensuous life are born as lower animals.<sup>14</sup> He also refers to the absorption

of disembodied souls in the Universal soul, and this can be reached through an ascetic and contemplative life.<sup>15</sup>

Like the *Upanisads*, Plotinus believes that through the analytic process of the dialectic,<sup>16</sup> the mind reaches its cherished goal and after reaching it becomes quiescent and unified. Here even thought disappears. It is the stage of supreme unity which is beyond even self-knowledge. Here the soul loses its identity and becomes "One." In the words of Plotinus:

But in the vision that which sees is not reason but something greater than and prior to reason, something presupposed by reason as is the object of vision. He who then sees himself when he sees will see himself as a simple being, will be united to himself as such, will feel himself, become such. We ought not even to say that he will see, but he will be that which he sees, if indeed it is possible any longer to distinguish between seer and seen, and not boldly to affirm that the two are One.<sup>17</sup>

In this theory of vision we have the direct influence of oriental philosophy of the Indian type.<sup>18</sup>

Like the *Upanisadic* philosophy Neoplatonism believes in the technique of entering into spiritual consciousness. Through meditation we can free the soul from its subjection to the body and attain union with the Divine. In order to attain this union we must strip everything of the body until the vision is attained. We must abstract from the body, from the soul, from sense perceptions, appetites and emotions, and from even the intellect with its duality. Then the soul touches and gazes on the supreme light.<sup>19</sup> In this account we may see a replica of the Indian theory of contemplation.<sup>20</sup>

Like the *Upanisads*, Neoplatonism has faith in a higher revelation to man in mystical experiences. Porphyry tells that during the period of five years when he lived with Plotinus, Plotinus was four times in union with God. Likewise he laid more emphasis on *Jñāna* (wisdom and contemplation) than on

*karma* or ritual ceremonies and looked upon *karma* as an enfeebled product of contemplation; and in the true spirit of mystic systems he rose above the political barriers of nations and states.<sup>21</sup>

Porphyry and other Neoplatonic philosophers also followed the path carved by their great teacher—Plotinus.

Porphyry<sup>22</sup> holds the salvation of the soul as the aim of philosophy. According to him the source of evil is not so much in the body as in the desires of the soul.<sup>23</sup> He advocates strict asceticism and abstinence from animal food.<sup>24</sup>

Iamblichus<sup>25</sup> accepted Plotinus's teachings with little variation. He suggests that man can obtain unification with the central source (God) not by his own efforts but by theurgic practices which must be performed correctly.

In the works of Proclus the living experience of Plotinus becomes a fixed tradition.<sup>26</sup> The metaphysics of being is approved by a doctrine of categories. He teaches that beyond all bodies is the soul's essence; beyond the souls is the intellectual principle; and beyond all intellectual substances is the One. The soul is incorporeal and independent of the body and therefore imperishable. To know the self truly is to know it as actually One, as potentially all things and as divine. He accepted the Neoplatonic trinity and explained the existence of the universe along Plotinian lines. He says that everything complete tends to reproduce itself. Every productive cause produces the next and all subsequent principles while itself remaining steadfast. Between the pure unity of the One and the minimal unity of matter, indeterminate sources are recognized.

Like mystics he advocates world citizenship. His saying, "the philosopher ought not to observe the religious customs of one city or country but ought to be the common hierophant of the whole world," reminds us of the *Vasudhaiva Kutumbakam* of Indian philosophy. Ascetic and contemplative virtue is rated higher than the practical. He gives devotional orientation to the Neoplatonism of Plotinus. Prayer for Plotinus was the turning of the mind to God; to Proclus it was

humble supplication for divine mind. He had superstitious respect for theurgy. He agrees with Iamblichus that individual things are united to the "One" by the mysterious operation of the occult symbols which reside in certain stones, herbs, and animals.<sup>27</sup>

Apart from these doctrines there are some other ones which have striking resemblances with the doctrines of Indian philosophy. For instance, the three hypostases of Plotinus resemble the three bodies of *Buddha*;<sup>28</sup> the Neoplatonic comparison of divine activity to the effortless and unpremeditated radiation of light by the sun reminds us of the description of *Brahman* in the *Upanisads* and of *Buddha* in the Buddhist texts;<sup>29</sup> and the doctrine of *Kenodoxia* (emptiness)<sup>30</sup> is a counterpart of the Upanisadic doctrine of *Avidyā*, or "Ignorance." The Hypocratical treatise "On Winds" resembles the more ancient doctrine of *Prāna* which forms a well-known topic of the *Taittirīya Upaniṣad*.<sup>31</sup> The *Maitrī Upaniṣad* stresses that we have to destroy our *abhimāna* and get rid of the sheaths hiding the self.<sup>32</sup> A medical theory in Plato's *Timaeus* resembles Indian medical theories.<sup>33</sup> The duration of the Heracleitian "Great Year" (10-8) is a decimal fraction which is based on Indian calculations.<sup>34</sup> The doctrine of the infinity of *Brahman* and the world, and the doctrine of identity between God and soul and between knowledge and *Brahman* are well-known topics of the *Upanisads*.

We can trace some elements of Vedic origin in Philostratus's *Life of Apollonius of Tyana*.<sup>35</sup> There are references to Avamedha,<sup>36</sup> to Vedic rites, and to Yogic powers.<sup>37</sup> There are certain striking resemblances in the matter of passage to Heaven. In the *Ṛg-Veda*, heaven is the home of the soul to which, after death, it returns purified;<sup>38</sup> before reaching Heaven it has to cross a stream<sup>39</sup> and pass by Yama's watchful dogs, "the spotted dogs of Sarama."<sup>40</sup> Further, the cradle of Neoplatonism was not the quiet university town of Athens, but the great manufacturing city of Alexandria which was at that time not only a great intellectual centre but also the place where East and West rubbed their shoulders, where the

wisdom of Asia was in high repute and where men of wisdom like Philostratus expressed the highest veneration for the learning of the Indians and even went to India to consult the *Brāhmana*s.<sup>41</sup>

The scholars<sup>42</sup> who try to find the hypostases of Plotinus in the "Trinity" of Plato and the simile of One and the sun in the *Republic* and other Platonic dialogues; the doctrine of *Kenodoxia* in Parmenides; the doctrine of infinity of *Brahman* and world in Melissus's "Being," in Anaxagoras' "Noûs,"<sup>43</sup> and in Heracleitus's "Soul"; and then emphatically assert that Neoplatonism is a legitimate development of Greek thought and Plato's own speculations<sup>44</sup>—forget the fact that these philosophers were also influenced by Indian thought through Orphicism and Pythagoreanism.<sup>45</sup>

In fact, the philosophy of Plato and even that of his independent disciple Aristotle was a kind of splendid digression from the main current of Greek speculation.<sup>46</sup> Plato's growing sympathy with Orphic and Pythagorean teachings; the devoutness and solemnity of his later attitude towards religion; the ethical rigorism of his old age, with its strongly marked ascetic tendency; his interest in Oracles and demons and the momentary appearance of an "evil soul" in the *Timaeus*, all point the way the wind was blowing.<sup>47</sup> Iamblichus, the biographer of Pythagoras and one of the greatest philosophers of Neoplatonism, clearly admitted that Plato, Aristotle, and he himself were all Pythagoreans.<sup>48</sup>

From the discussion above we may draw the conclusion that some of the fundamental doctrines of Neoplatonism which have striking similarities with the doctrines of Indian philosophy were well-established in the *Upanisads* at least in the 6th century B.C.—long before the rise of Neoplatonism.

## II

As regards the second question, as to whether certain views of Plotinus are of Indian origin and involve abandonment of

the Greek tradition of rational critical thought, a brief summary is necessary of those systems which represented an opposite stream of thought and through which Indian philosophy had penetrated the minds of Greek thinkers.

Among these systems the Orphic was the most outstanding. In it we find a mystical theology, a code of conduct for moral life, a system of purificatory and expiatory rites,<sup>49</sup> which believes in the universal brotherhood of all beings, in the existence of God (Dionysius), in the immortality<sup>50</sup> and divinity of Soul, and in the state of ecstasy where soul sees the vision of God. If a man leads a moral life and subdues his passions and appetites through ascetic practices such as a life of chastity, abstinence from beans and fish, the wearing of ordained clothes, and avoidance of bloody sacrifices, he can reach divinity within this very lifetime.

Like Orphic religion Eleusinianism<sup>51</sup> also believes in the immortality and the divinity of soul. It says that dark shrouds are wrapped round the soul; man can unwrap them through initiation and can become divine. At the end of the initiation the initiate hears the last words from his teacher, "Go in peace," which remind us of the Upaniṣadic "Om Śāntih, Śāntih, Śāntih."<sup>52</sup>

The Pythagorean school<sup>53</sup> was also influenced by Orphic culture. Likewise it believed in the immortality of soul, in the doctrine of rebirth,<sup>54</sup> and in the purification of soul through ascetic practices like self-control. Pythagoras, like the Upaniṣadic philosophers, believed that all souls are identical by nature. The apparent distinctions between human beings and other beings are not ultimate. A man, through *theoria*, "the contemplation of the divine," can realize his true nature and be free from the wheel of transmigration. It is said that Pythagoras had travelled widely studying the teachings of Egyptians, Assyrians and Brāhmanas, and was greatly influenced by India in his religious, philosophical and mathematical teachings. Even in the formulation of his famous theorem of the quadrature of the hypotenuse he was influenced by India where it was already known in the older Vedic

times, long before Pythagoras.<sup>55</sup> Like the Jains and the Buddhists he refrained from violence and eating meat and regarded certain vegetables as taboos.<sup>56</sup>

Like Pythagoras, Empedocles also believed in the divinity and immortality of soul; in the doctrine of rebirth and its final release from the world of sense; and in the attainment of divine status through asceticism.<sup>57</sup>

Socrates also believed in the same doctrines of meditation, immortality of soul, renunciation of the world and brotherhood of all mankind which are Orphic in nature and are quite different from the ritualistic religion of the Greeks. He believed in an inner voice (*Daemon*) and rational self-discipline.<sup>58</sup>

In Plato the mystic tradition reached its zenith. He believed in the immortality, divinity and transmigration of soul, and the super-sensible (beatific) vision of the philosopher. The simile of the cave reminds us of the doctrine of *māyā*. Like Indian philosophers he held that body is a fetter<sup>59</sup> for the soul which can be broken through the pursuit of wisdom. Like Hindus he believed that God is perfect righteousness and those of us who are most righteous are most like him.<sup>60</sup> His doctrine<sup>61</sup> of "*Logistikon*, *Thumos*, and *Epithumia*" reminds us of the Sāṅkhya doctrine of the *guṇas* (*sattva*, *rajas* and *tamas*, respectively). The division of souls into three classes based on the preponderance of these psychical elements answers to the divisions of the Indian caste system.<sup>62</sup> The concept of the Age of Kronos in Plato, which is similar to the Golden Age of Hesiod, seems to be a new version of the four *yugas* of the Hindus.<sup>63</sup>

In the end of the *Republic* Plato advocated the doctrine of *karma*. The disembodied souls are represented as choosing their next incarnation at the hands of Lachesis, daughter of necessity, who is the Law of *Karma* personified; and like Indian philosophers he held that the endeavour of philosophy is to ascend to the first principle of the universe which transcends all definite existence.<sup>64</sup>

We have in Plato as in the *Upanisads* the highest God—the idea of the Good in the *Republic*, the Demiurgus and the soul of the world in the *Timaeus*.

In the mystic cults and the teachings of Pythagoras, Plato, Socrates and the Neoplatonists, we find a decisive break with the Greek tradition of rationalism and humanism. The mystic cults are definitely un-Greek and anti-Hellenic in their character.<sup>65</sup> They are different from the anthropomorphic worship of the Greeks. Their adherents are organized in communities based on voluntary admission and initiation. Their cosmogony and eschatology are foreign to the Greek spirit. Homer is not troubled by the problem of the origin of things. He knows of no world egg which plays a prominent part in many cosmogonies and in Orphism. Those who are familiar with the Vedic hymn of creation will note that the conceptions of night and chaos and the birth of love, as well as the cosmic egg, are accepted by the Orphics.<sup>66</sup>

To seek to become like the gods is to the orthodox Greek the height of insolence, though it is of the essence of the Orphic religion. We have the typical Greek reaction to the Orphic doctrine "God am I, mortal no longer" in the following lines of Pindar:

Seek not to become a god; seek not to become Zeus;... mortal things befit mortals best. Mortal winds must seek what is fitting at the hands of the gods, recognizing what is at our feet, and to what lot we are born. Strive not my soul, for an immortal life, but do the thing which it is within thy power to do.<sup>67</sup>

Hailer says:

Genuine Greek religion knows no mystical striving after a blessed union with God in ecstasy after an abolition of the limits of individuality in a realm beyond the conscious life. Prophetic austerity and mystic indifference are alike foreign to it.<sup>68</sup>

On the other hand, Orphic religion was a religion of an entirely different kind from the civic worship to which the ordinary Greek professed his allegiance.<sup>69</sup> It did not enjoin the practice of the civic virtues, nor is discipline or transformation of character required by it; the sum total of its morality is to bend one's course towards the deity and turn away not from the moral lapses and aberrations of earthly life, but from earthly existence itself.<sup>70</sup>

In Plato's philosophy, as we have discussed earlier, there is not even a single concept which is in tune with the Greek theology. The essential unity of the human and the divine spirit, the immortality of the human soul, the escape from the restless wheel of the troublesome journey, the phenomenality of the world, the contempt for the body, the distinction between knowledge and opinion, contradict every single idea of Greek popular religion.<sup>71</sup>

In him we find the most eminent representative of the heretics<sup>72</sup> whose minds were heavily charged with an Orphic mysticism mainly derived from Asiatic sources. India, always the home of mystical devotion, probably contributed the major share.<sup>73</sup> In the words of Dr. Inge, "the Platonic or the mystical outlook on life for which religion is at once a philosophy and a discipline" was first felt in Asia, especially in the *Upanisads* and Buddhism,<sup>74</sup> and it influenced the entire Greek culture. In fact, Greek culture rose against an oriental background from which it was never isolated, save in the minds of classical scholars.<sup>75</sup> Tarn is also of the same view. According to him, "Egyptian, Persian and Indian cultural influences were absorbed into the Greek world from very early times."<sup>76</sup> In the words of Prof. Mayer, we may conclude that though alien in origin, alien to the spirit of Hellenism, predominantly Indian in character and content, walking in the shadow without support from the state, the Orphic, the Eleusinian, and the Pythagorean brotherhoods and the Platonic schools prepared the way for later Platonism and for certain elements in Catholic theology.<sup>77</sup>

Some scholars may not agree with our conclusions. They might think it derogatory to the Greeks to assume them to have taken some of the sources of their knowledge and beliefs from older times. But there may be no denying of the fact that these ideas are similar and that they were firmly established in India before the sixth century B.C. and arose in Greece after that period. History does not repeat itself except with variations and there is no dearth of historical evidence which proves the relation between India and Greece from time immemorial. Nor was there any spirit of bigotry in the Greeks not to learn anything which was alien in origin.<sup>78</sup>

### III

As regards the third question, whether chronologically some of the views of Plotinus first appeared in India or in Greece, the picture is clear. Since the Vedic Age—the second millennium B.C.—we find close agreements between the language and the mythology, religious traditions and social institutions of Indians and Iranians, on the one hand, and those of the Greeks, Romans, Celts, Germans, and Slavs, on the other. The gods of Father Heaven (*dyauspiter*, Jupiter), Mother Earth (Aurora, *Usas*), and the Sun (*Sūrya*) are common to Greeks and Indians. The Olympian religion of the Greeks and Vedic beliefs had a common background. There is also a striking similarity between the social life described in the Homeric poems and that of the *Veda*. Both are patriarchal and tribal. These facts indicate that these two cultures had a common origin at some early date. Thus in the *Rg-Veda*, the European will find memorials of his own racial inheritance.<sup>79</sup> In so far as we are Aryan in speech, that is, in thought, so far the *Rg-Veda* is our own oldest book, says Max Müller.<sup>80</sup>

Twice<sup>81</sup> the Vedic god Mitra,<sup>82</sup> who is known as Mithra in the language of Avesta, conquered a great part of the Western world, and became a favourite deity of the emperors. Aurelian won victory in his name in 270 A.D.. Galerius and Licinius

dedicated a temple to his name in 307 A.D. at Carantum on the Danube.

Commerce between the mouth of the Indus and the Persian gulf was unbroken down to Buddhist times. We have evidence of trade by sea between the Phoenicians of the Levant and Western India as early as 975 B.C., when Hiram, king of Tyre, imported ivory, apes and peacocks for decorating the palaces and the temple of Solomon.<sup>83</sup>

Trade between the Indus Valley and the Euphrates also seems to be very ancient. For we find in the cuneiform inscriptions of the Mittite Kings of Mittani in Cappadocia, belonging to the sixteenth or fifteenth century B.C., the names of the Vedic gods—Indra, Mitra, Varuṇa, and the Āśvins.<sup>84</sup>

In the sixth century B.C. India and the West became closer when, after the fall of Babylon in 538 B.C., Cyrus founded the Persian Empire and Darius his successor made the Indus Valley and Greece part of his empire (510 B.C.).

The presence of a large body of troops in Darius's expedition against Greece in 480 B.C.; the discovery of the modelled heads of Indians at Memphis about the fifth century B.C.; and the first book about India by Scylax<sup>85</sup> in 510 B.C. show that there was a close connection between India and Greece in political, cultural and economic fields. The rise of philosophical reflection in Greece and the revolt against the traditional Homeric religion belong to this period. There we find Xenophanes, Parmenides, Zeno and Anaxagoras, who laid down the foundations of Greek metaphysics, which has a great resemblance with the Upaniṣadic doctrine of "Reality."<sup>86</sup> The mystical schools of Greek philosophy—Orphism, Eleusinianism, and Pythagorean cults—also belong to this period which exerted great influence on the formulation of the fundamental doctrines of Greek philosophy. These schools influenced Alexander the Great, Julius Caesar and the Bacchies of Euripedes.<sup>87</sup> The tragic poets Aeschylus, Sophocles, and Euripedes were also interested in their moral philosophy.

We have a reference to Greek inscript in the *Aṣṭādhyāyī* of Pāṇini.<sup>88</sup> Eudoxus,<sup>89</sup> the astronomer and friend of Plato, was greatly interested in Indian thought. We have also a tradition in Aristoxenus<sup>90</sup> which mentions the visit of Indian thinkers to Athens and their conversation with Socrates. All these factors provide contemporary evidence for the prevalence of Indian thought in Greece in the 4th century B.C.

The invasion of India by Alexander the Great in 327 B.C. was a turning point in the history of Indo-Greek relations. It was not only the march of an army but also the march of thought. Alexander had marched along with Pyrrho and Onesicritus<sup>91</sup> who acquired a great deal of knowledge of Indian thought, and returned with many Indian thinkers including Kalanos, an Indian philosopher. This event changed the entire course of the history of the Academy. The philosophy of Plato was replaced by the philosophy of Pyrrho, and the Greek ideal of "happiness" gave place to imperturbability of soul.

With the advent of Chandra Gupta Maurya on the political horizon of India, the Indo-Greek relationship started on the ambassadorial level. The principal successor of Alexander the Great, Seleucus Nikator (third century B.C.), sent Megasthenes as ambassador to Chandra Gupta Maurya. He has given a very good account of the India of the 3rd century B.C. He says that in many points their teaching agrees with that of the Greeks.<sup>92</sup> After Megasthenes, Diamachus of Plataea was sent to Bindusāra as ambassador by Antiochus I and Dionysius was sent by Ptolemy Philadelphus of Egypt. He lived in India from 285 to 247 B.C.<sup>93</sup>

During the reign of Aśoka, who ascended the throne of Magadha in 272 B.C., the military expedition started by Alexander the Great was turned into an expedition for peace. He held a Council<sup>94</sup> at Pāṭaliputra where it was decided to send missions to various countries to spread Buddhism. Accordingly, delegates were sent to five sovereigns of the West, namely, Antiochus Theos of Syria, Ptolemy Philadelphus of Egypt, Antigonus Gontos of Macedonia, Magas of Cyrene, and

Alexander of Epirus.<sup>95</sup> These missions were received favourably.

Again, during 190-180 B.C., the Bactrian empire was extended into India by Demetrius, and Dindha and Kathiawar became its provinces.

During these centuries thousands of Greeks who settled in India became Indianized and accepted Indian religion and philosophy as their own. The erection of the column of Vāsudeva by Heliodorus<sup>96</sup> in 140 B.C., and the conversions of Menander<sup>97</sup> and Kanishka to Buddhism amply demonstrate this fact. We also know from history that Alexander Polyhistor of Asia Minor had a good deal of knowledge of Buddhism; a senior priest of Yona country attended the foundation ceremony of the great tope on the initiation of King Duttahagāminī which was held in 157 B.C., accompanied by thirty thousand priests;<sup>98</sup> the Indian king Poras sent an ambassador to Augustus in 20 B.C., along with an Indian thinker;<sup>99</sup> and Apollonius of Tyana went to India to consult the Brāhmanas.

In the work of Hippolytus which was written in 320 A.D., at least 25 years before Plotinus left Alexandria for Rome, we come across many passages which give a very detailed account of the philosophy of the *Maitrī Upaṇṣad*. This knowledge cannot have resulted from the records of the historians of Alexander the Great, for there is a clear reference to the river Tāgabena (Tūṅgabēnā) of South India.<sup>100</sup> Plotinus,<sup>101</sup> the founder of Neoplatonism, was himself anxious to acquire a first-hand knowledge of Indian philosophy and with this in mind accompanied King Gordian in his expedition against the Sapor of Persia in 242 A.D.. Due to the sudden death of the King at Mesopotamia his dream could not be realized. Porphyry, the illustrious disciple of Plotinus, had a good knowledge of Indian philosophy. In his *De Abstinentia* he has given a good account of some Indian views on the authority of Bardesanes which the latter had acquired from an Indian ambassador to the Imperial Court early in the third century.<sup>102</sup>

In the presence of these historical data we may conclude that Indian thought might have played a great part in the

development of the doctrines of Neoplatonism, and that Neoplatonism might be the result of the religious syncretism which arose from the conquests of Alexander the Great and the undertakings of the Roman Empire.<sup>103</sup> Modern ontologists also support the above conclusion and hold that all the resemblances between the similes used by Greek and Indian writers cannot be explained simply by reflection on earlier Greek ideas.<sup>104</sup> But in order to give the final verdict on this subject we must await future researchers who will uncoil the mysteries with their knowledge of Indian and Greek traditions.<sup>105</sup>

## A Survey of Modern Scholarly Opinion on Plotinus and Indian Thought

---

Albert M. Wolters

*Institute for Christian Studies  
Toronto, Ontario*

I take it as my task in this paper to give a brief orientation, in broadest outline, in the twentieth century literature surrounding the general theme, "Plotinus and Indian Thought." Please note the restriction to Plotinus; I will touch only incidentally on Neoplatonism in general. Similarly, observe that I shall be concerned chiefly with Plotinus and *Indian* thought in particular, treating only incidentally the much broader question of "oriental influences" upon Plotinus in general.

I should add, furthermore, that I speak as a student of the general history of Western philosophy, who has done some specialized work in Plotinus. This means, for one thing, that my angle of vision is definitely that of the *Western* historiographer of philosophy; Indian philosophy appears in my horizon chiefly as a possible source of influence upon my own field of study, and I claim no expertise whatever in the other area.

Secondly, my position as a student of Western philosophy in general determines my interests in questions of *historiographic methodology* and it is from this point of view that I

wish to survey the literature in question. It is my intention, therefore, to take a glance at twentieth century scholarship on the question of Plotinus and Indian thought with the following methodological focus: can "Indian thought" be properly considered an 'influence', 'source', or 'determinative factor' on Plotinus, and what kinds of criteria are legitimate in deciding such a question?

I adopt this focus not only because it squares with my own interests as historian, but also as justification for giving this paper at all. The fact is that there are already in existence at least two excellent essays on my subject, and I want to do more than merely repeat or supplement them. The two essays in question are the following: the appendix entitled "The problem of Indian influence on Neoplatonism" in J. F. Staal, *Advaita and Neoplatonism, A Critical Study in Comparative Philosophy*, published in Madras in 1961,<sup>1</sup> and the article by H. R. Schlette entitled "Indisches bei Plotin" first published in the Festschrift *Einsicht und Glaube* in 1962,<sup>2</sup> and reprinted, with slight revisions, in his *Aporie und Glaube* in 1970.<sup>3</sup> Both of these essays (neither of which refers to the other, having been written at about the same time) appear to have remained relatively unknown: Staal's probably because it was published in Asia, and Schlette's because it is tucked away in two collections of largely theological essays. Although I am indebted to both Staal and Schlette, my scope is broader than theirs, and I differ from them both in their conclusions and in the methodological focus which I will adopt.

The nineteenth century saw the development of the problem of "oriental influences" on Plotinus. Can Plotinus be understood exclusively as an original development of the Greek tradition, or must we have recourse to extraneous influences from "the East" to account for the distinctive features of his philosophy? It is basically the former position which is taken by such historians of philosophy as Hegel,<sup>4</sup> Kirchner,<sup>5</sup> and Zeller,<sup>6</sup> whereas the presence of "Orientalismus" in Plotinus is defended by such scholars as H. Ritter,<sup>7</sup> Victor Cousin,<sup>8</sup> and E. Vacherot.<sup>9</sup> Especially H. Ritter is of

interest for our purposes, since he for the first time (to my knowledge) looks upon Plotinus and Neoplatonism as heirs to the *Upanisads*. However, Ritter is an exception, in this regard, and his extravagant overstatement of the case of *Indian* influence had the effect of bringing the whole thesis into dispute. After Ritter, the case for "oriental influences" had reference virtually exclusively to Iranian and Egyptian factors.

It is important to note a curious complicating factor at this point. The debate for and against Eastern sources of Plotinus's thought was equated with a debate for and against the "purity" of his philosophy. It was generally assumed that the Greek tradition stood for clarity of thought, rationalism, objectivity and philosophical respectability. Anything coming from "the East" was somehow a contaminating impurity, and had overtones of superstition, mysticism, irrationalism and *Schwärmerei*. To admit "oriental influences" on anyone was tantamount to besmirching his good name. A good example of this pervasive prejudice (which underlies a good deal of the twentieth century discussion as well) is the notorious article on Plotinus by the Austrian philosopher Franz Brentano entitled, "Was für ein Philosoph manchmal Epoche macht" (1876),<sup>10</sup> a virulent diatribe against Plotinus as betrayer of the Greek tradition.

It is against this background that we must see the influential article "Orientalisches bei Plotin?" published by H. F. Müller in 1914.<sup>11</sup> Müller (died approximately 1918) was a Plotinus devotee who had spent a lifetime studying, elucidating, editing and translating the *Enneads* in a time when Neoplatonism in general was considered a manifestation of the decadence of Greek philosophy, and his article passionately defends Plotinus against any suspicion of contamination by "oriental influences." His first two sentences sum up the burden of the argument: "The question whether the thought of Plotinus was subject to oriental influences must be answered with an unqualified 'no' (*muss rundweg verneint werden*). This philosophy is a genuinely Hellenic growth (*ein echt hellenisches Gewächs*)." The body of the article is devoted to

refuting one by one all arguments to the contrary. Plotinus is against the exorcism of demons, he has no truck with theurgy and the mystery cults, he has no use for astrology, he is unjustly accused of *Schwärmeret* and theosophy (p. 78). He was a mystic, to be sure, but then so was Plato (p. 79). When we read the *Enneads* "it is pure Platonic air which surrounds us, not oriental mist and fog."<sup>12</sup> The article concludes therefore: "What Plotinus thought, taught and lived he owes to the Greeks, especially the divine Plato."<sup>13</sup>

Müller's article is important for a number of reasons. One is that it does not occur to him to refute the suggestion that Plotinus was influenced specifically by *Indian* thought. Apparently, this was not considered a serious option at the beginning of our century. Another is the obvious prejudice against any movement, theme or image associated with the East; Müller is clearly concerned to indicate the Hellenic 'purity' of Plotinus. And finally, Müller's article is important because it was enormously influential. It has been widely quoted since in Plotinian scholarship, and to my knowledge always with approval. His phrase "ein echt hellenisches Gewächs" has become something of a winged word, which might stand as a motto over by far the greatest part of what has been written on this subject since.<sup>14</sup>

It is in fact the case that, within the world of Plotinian scholarship since its renaissance after the First World War, there has been an almost overwhelming consensus that Plotinus must be understood strictly in terms of the Greek tradition, and that all influences from "the East" whether they be Iranian, Jewish, Egyptian or Indian, are to be considered at best improbable, marginal, or irrelevant. In the words of A. W. Benn, "there is nothing Oriental about Neoplatonism. All its component elements may be traced back to purely Greek thought."<sup>15</sup> With the one significant exception of Émile Bréhier, about whom we will speak in a moment, every leading Plotinus scholar of the twentieth century downplays any but Greek factors in accounting for the development of Plotinus's thought.

It would be wearisome to list all the testimonies which can be adduced to back up this assertion. Let me do no more than give a brief sampling of statements to this effect by a number of the most eminent students of Plotinus:

1. A. H. Armstrong: "[Plotinus] never in fact established any sort of contact with Eastern thinkers; and there is no good evidence, internal or external, to show that he ever acquired any knowledge of Indian philosophy."<sup>16</sup>

2. H. R. Schwyzer: "A derivation [of the identity of the self and the One in Plotinus] from India is impossible, if only for external reasons. . . . Plotinus's thought can be understood as an organic elaboration of the Platonic philosophy."<sup>17</sup>

3. Vincenzo Cilento: "That is why Plotinus's mysticism has a character all its own, the character of a genuine Hellenic, in fact Platonic, growth, and is not contaminated by oriental influences."<sup>18</sup>

4. Paul Henry: "Thus Plotinus is not only historically but also logically the culmination of Greek philosophy."<sup>19</sup>

5. Jean Trouillard: "Thus we can simultaneously posit both that Plotinus's philosophy is an authentic unfolding of Platonism, and that, on the basis of that starting point, it is a genuine creation."<sup>20</sup>

More telling perhaps than these quotes is the argument from silence which we can derive from those explicit discussions of the 'sources' of Plotinus which fail altogether to mention Indian thought. Most notable among these is of course the volume *Sources de Plotin*, the publication of papers and conversations held at Vandoeuvres in 1957.<sup>21</sup> None of the papers there presented deals with possible oriental sources, let alone specifically Indian influences. The same can be said of the section "Zur Frage der Quellen Plotins" in the recent introduction and bibliographic guide to Plotinian thought and scholarship by Schubert Venanz.<sup>22</sup>

Yet the consensus is not complete on this point. The notable exception among leading Plotinus scholars in this regard is Émile Bréhier, the well-known French translator of

the *Enneads*. In a course on the philosophy of Plotinus which he gave at the Sorbonne in Paris, in the winter of 1921-22, he put forward the thesis that Plotinus must have been influenced by Indian thought. These lectures were published in 1928 as the book *La philosophie de Plotin*.<sup>23</sup> Chapter 7 deals with "L'orientalisme de Plotin," in which he makes his case for Indian influence.

In brief, his argument is as follows. Plotinus's conception of the Intellect (*νοῦς*) is ambivalent; on the one hand it is 'rationalistic', opposing a clearly defined object to a rational subject, but on the other hand it is 'mystical', whereby the subject becomes identified with all objects indiscriminately. It is this second feature, "the identity of the self with universal being," which is unprecedented in Greek philosophy, and must derive from elsewhere. It can not derive from the mysticism of the oriental cults, because these all presuppose cultic ritual and a salvation mediator, both of which Plotinus rejects. "Therefore," Bréhier concludes, "I am led to look for the source of Plotinus's philosophy beyond the Orient close to Greece, and to go as far as the religious speculation of India, which in Plotinus's day had already been fixed for centuries in the *Upanishads* and had kept all its vitality."<sup>24</sup>

Müller's arguments do not count against this hypothesis, since he does not deal with the possibility of specifically Indian influences on Plotinus. The fact is that "in Plotinus we thus grasp the first link of a religious tradition which is ultimately no less powerful in the West than the Christian tradition. . . . In my view this tradition goes back to India."<sup>25</sup> This is not as strange as it may seem, since the Greeks had long been fascinated by the East, including India, and had had dealings with it. We know too that Plotinus was interested in Indian philosophy. Moreover, the similarities between Plotinus and Indian thought had already been pointed out earlier by the German philosophical historians Ritter, Deussen and Oldenberg.

As we have already indicated, Bréhier's thesis was not received with favour by his colleagues in Plotinian studies,

who almost to a man rejected his arguments. Representative of the general negative response to Bréhier was the article "Plotinus and India" by A. H. Armstrong, which appeared in the *Classical Quarterly* in 1936.<sup>26</sup> In it Armstrong did not deny that there *might* have been Indian influence, but argued that there was no definite evidence in favour of it. Nor did he deny that the parallels adduced by Bréhier between Plotinus and the *Upanishads* were striking; his point instead was that it is "unnecessary to go outside the tradition of Greek thought in order to explain Plotinus."<sup>27</sup>

To make his case Armstrong brings forward the following considerations:

1. "There was never a people which in its thinking was less open to any real influence from abroad [than the Greeks]."
2. Plotinus's allusions to oriental culture and his early interest in Eastern philosophy prove nothing with regard to any influence on him.
3. The "subjective idealism" of Plotinus can be accounted for by reference to Greek antecedents. There was a streak of irrationalism in Greek thought which goes back to Heraclitus and Euripides, and is prominent in the *Hermetica*, roughly contemporary with Plotinus. But even Greek rationalism contained the seeds of Plotinian "pantheistic idealism," since the notion of infinity in the intelligible world is prefigured in Anaximander's *ἄπειρον* and the Stoic doctrine of the *ἰδίως ποιόν*, whereas the non-distinctness of the ego has roots in pre-Socratic philosophy and Aristotle's *νοῦς χωριστός*.
4. An overwhelming sense of man's alienation from a Fate-ruled world was prevalent in Plotinus's day, and could well give rise to doctrines such as the ultimate identity of one's innermost self with a transcendent principle.

Since the time of Armstrong's article, research into the Greek antecedents of Plotinus's thought has made great progress, and the arsenal of arguments for explaining Plotinus in exclusively Greek terms has become significantly greater. We need only mention the later work of Armstrong himself,<sup>28</sup>

and of Willy Theiler,<sup>29</sup> Philip Merlan,<sup>30</sup> Cornelia de Vogel,<sup>31</sup> and H. J. Krämer<sup>32</sup> to realize how much ammunition has been gathered to undermine the necessity of Bréhier's thesis of an Indian influence on Plotinus.

An attack on Bréhier's thesis from a different quarter was launched by J. M. Rist in the chapter on "Mysticism" in his book *Plotinus: The Road to Reality* (1967).<sup>33</sup> Basing himself on the distinctions made by R. C. Zaehner between different types of mysticism, Rist contends that one of Bréhier's main premises, which had been admitted by Armstrong, is invalid, namely that the mysticism of Plotinus and that of the *Upanisads* is of the same type. Rist argues that Plotinus holds to a 'theistic' mysticism, i.e., one in which the experiencing subject does not lose its individuality in the mystical experience. The mysticism of the *Upanisads*, on the other hand, is of the 'monistic' kind, where this does not appear to be the case. If the doctrines are thus significantly unlike, concludes Rist, "derivation or significant influence can be forgotten."<sup>34</sup>

One might suppose therefore, that Bréhier's proposal found little or no support after it was first launched. Bréhier himself seems to have thought so. In 1948, four years before his death, Bréhier was asked whether he still held to his theory respecting an Indian influence on Plotinus, and he replied:

I raised the question. I was not able to resolve it. I thought at that time that the matter might interest those who concern themselves with India. I found a number of very definite relationships between the Neoplatonists and India. But I found no one who was interested, and the question remains to be studied.<sup>35</sup>

Yet this was not the case. For while it was true that Bréhier's thesis found almost no support within the world of Plotinus scholarship, a number of other scholars, chiefly Indologists, have picked it up and developed it. Moreover, at

least one scholar seems to have reached similar conclusions independently.

First of all there are the three ill-fated articles by J. Przyłuski which appeared in the 1930's.<sup>36</sup> Taking Bréhier's lead, these attempted to show a doctrinal similarity between Buddhist thought and certain trinitarian themes in Gnosticism, Plotinus, and Christianity, and furthermore, to identify Mani as a possible intermediary between India and the West. Przyłuski's work has been subjected to a devastating critique by A. B. Keith,<sup>37</sup> H. Puech,<sup>38</sup> and J. F. Staal.<sup>39</sup> One of the most damaging criticisms was that chronological considerations made the alleged influences impossible. Indian influence is also postulated by P. Marucchi in his article, "Influssi indiani nella filosofia di Plotino?" (1953),<sup>40</sup> and striking similarities are pointed out by Olivier Lacombe in his "Note sur Plotin et la pensée indienne" (1950).<sup>41</sup> This last article, written by an eminent Indologist, is especially significant, because it bears out Bréhier's point about the structural parallels between Plotinus and the *Upanisads*, yet refuses to deduce a historical influence from this fact.

Bréhier's thesis was thus not wholly without support, even though his followers, like himself, had to contend with some very powerful opposition. Moreover, a connection between Plotinus and Indian thought was postulated in another article in 1938, on other grounds than, and apparently without prior knowledge of, Bréhier's work. Arpad Szabó in an article entitled, "Indische Elemente im plotinischen Neuplatonismus"<sup>42</sup> sees an influence of Sāṃkhya philosophy on Plotinus's doctrine of the fall of the soul. According to him, the view that the union of soul and body is an illusion is one of the conflicting sides of Plotinus's tension-ridden anthropology, and cannot be explained in terms of the Greek tradition, since the latter knows only a culpable fall of the soul into the body (the other side of Plotinus's thinking). Accordingly, writes Szabó, "We are forced to look for the analogies and sources of this train of thought in Indian philosophy," and more

specifically in Sāṅkhya philosophy, since a similar view of the soul's embodiment as illusion is found there.<sup>43</sup>

Szabó's thesis, however, has fared even worse than Bréhier's. J. F. Staal,<sup>44</sup> for example, has pointed out that Plotinus does *not* conceive of embodiment as an illusion, even though the embodied soul is sometimes called εἶδωλον. Moreover, the Sāṅkhya texts to which Szabó appeals to make his case are to be dated centuries *after* Plotinus. It is therefore not surprising that Szabó's article appears to have had little influence in subsequent discussions.

To conclude my overview, I would like to draw your attention to the two essays which I mentioned at the beginning of my paper: those by Staal and Schlette. These are both substantial studies which have taken into account most of the literature before 1960, and come to conclusions which are methodologically similar. It seems to me that they probably reflect the general state of the question prior to the present conference.

The basic situation to which both Staal and Schlette react is made up of the following basic components:

1. It is historically *possible* that Plotinus was in contact with and influenced by Indian thought. We know from Porphyry's *Life* that he had some interest in Indian philosophy, we know that there was some knowledge of Indian thought in the West at that time,<sup>45</sup> and Alexandria was a crossroads for cultural contacts between East and West. However, we have no definite evidence that Plotinus ever did in fact become acquainted with Indian thought, and the *Enneads* reflect only a very intense preoccupation with the Greek philosophical tradition. The possibility of actual contact with India remains an unsubstantiated *possibility*.

2. There do appear to be similarities of doctrine, especially with regard to Plotinian mysticism (although there is very little agreement as to how striking these similarities are). The important methodological question therefore is: do possible contact and doctrinal similarity add up to probable *influence*?

Staal and Schlette both answer "no," although their emphasis is different.

Schlette concludes his survey of the literature as follows:

Influences of Indian thought on Plotinus are possible, but have so far not been demonstrated, perhaps they are not demonstrable at all, or only to a very slight degree; the comparative method can not in principle answer the historical question.<sup>46</sup>

However, this does not mean, for Schlette, that it is therefore illegitimate to speak of "Indian elements in Plotinus" (*Indisches bei Plotin*), if there are doctrinal parallels to be observed. He writes,

If it could be shown that such a material (*sachliche*) affinity must in fact be assumed, then it would be perfectly legitimate to speak of Indian elements in Plotinus, even if such a connection would not (now or ever) be demonstrable in historical and literary terms.<sup>47</sup>

He then proceeds to identify five themes of "Indian thought" in general which have, in his opinion, an "inner affinity" with Plotinus's philosophy. These are the following:

1. the identity of *ātman* with *brahman*;
2. the striving toward union with the divine being;
3. the knowledge of the ineffability (*Unnennbarkeit*) and heterogeneity (*Andersartigkeit*) of the divine mystery;
4. the law of *karma* and of reincarnation;
5. the interpretation of this-worldly reality as deceptive, illusory *māyā*.<sup>48</sup>

I am not aware of any critical reaction to Schlette's article, and take this opportunity to voice the following comments of my own about his argument. It seems to me extremely misleading to speak of "Indian elements in Plotinus" in this

sense. By his definition it would be equally valid to speak of "Plotinian elements in Indian thought" which implies something quite different. Moreover, I wonder whether the five themes mentioned are indeed characteristic of *all* Indian thought. Finally, there is an "inner affinity" of some of these themes not only with Plotinus, but also with other Greek thinkers (cf. the fifth point and the whole Platonic tradition).

Finally, a word about the attitude of J. F. Staal, as exemplified in his work on Advaita and Neoplatonism. Staal too denies the probability of historical influence of Indian thought on Plotinus, but unlike Schlette he does not advocate speaking of Indian elements in him all the same. The question of whether or not one considers Indian influence probable is ultimately decided, argues Staal, by one's philosophical convictions. It all depends on one's view of historical causality. In this there are two extremes: the doctrine of the 'preexistence of the effect in the cause' and the doctrine of *creatio ex nihilo*. Staal elucidates this as follows:

Whoever is inclined, perhaps unconsciously, to the last view, will tend to stress points which are common to a certain field and its preceding background, and interpret these as effect and cause respectively; whoever is inclined to the other view will stress the differences and try to show that there are elements of the later phenomenon counterparts of which cannot be found in the earlier phenomenon.<sup>49</sup>

Applied to Plotinus, in other words, the first approach would tend to dissolve him into his sources, going as far afield as India to account for features which Greek sources can not explain. The second approach would stress Plotinus's originality as a creative thinker, and feel no need to adduce literally far-fetched parallels. Staal makes no secret of his own stance in the matter: "It will be seen how far our comparative study depends upon the view which stresses *creatio ex nihilo*, for in

comparisons we will often stress differences."<sup>50</sup> The constant emphasis of Staal's comparative study, accordingly, is to relativize the similarities in favour of the dissimilarities, and to consider "influence" as a category in intellectual historiography which must be viewed with caution, if not downright suspicion.

In my opinion, Staal has put his finger on an important point in all discussions of "influences" and "sources" in the history of philosophy. Our judgments in these matters tend to be biased by fundamental attitudes to the nature of history, and I for one would like to plead for a greater recognition of originality and creativity in the history of philosophy. For that reason, I am predisposed to side with those who reject the probability of Indian influence on Plotinus. However, does this mean that I therefore favour the approach which seeks to "explain" Plotinus in strictly Greek terms, as the majority of interpreters of Plotinus have tended to do? I think this is not necessarily the case. I think there is perhaps good reason to be cautious of the notions of "influence" and "source" also when applied to the Greek antecedents of Plotinus. There is overwhelming evidence that Plotinus lived and moved in the horizon of the Greek philosophical tradition, but there is no evidence that he was a prisoner of it. The greatness of Plotinus as a philosopher is partly measured by the fact that he brought much that was historically *new*, something that cannot be reduced to antecedent factors. It is this which all Plotinian *Quellenforschung* forgets at its peril.

## Neoplatonism, Indian Thought, and General Systems Theory

John R. A. Mayer

Brock University  
St. Catharines, Ontario

### I

William James speculated that for the infant who has not yet grown into language the experienced world is probably a booming, buzzing confusion. As language is appropriated the perceived manifold gains some order, some structure. The strangeness and perhaps the wonder transmute into the familiar, the homey, the expected.

If this account of original human experience is more or less plausible, and it seems so to me, then one can conclude that the first and untutored experience of man is one of multiplicity, of a manifold of many dimensions. Not only are there different shapes and colours, but there are sounds and sights and textures; there are things, there are feelings, there are events, there are dreams. Desires, images, moods rise and vanish; situations, surprises irrupt and alter the horizons of awareness, shifting one's focus of attention from this to that.

And for many people it seems that while the content of experience continues to increase, and the structuring vocabulary gains progressive sophistication, the fundamental development of consciousness halts here, and the rest of one's life interests are centered on the accumulation of experience, information and its analysis.

It could be shown, however, that even as the manifold manifests itself in its manyness, there is already in the background an inexplicitly and consciously inaccessible requirement of a contrast—the structure which makes the manifold coherent and orderly, patterned, cyclical, recognizable in the sense of *re-cognizable*.

In all likelihood this background is the source of language, making generic terms apparently appropriate to the concrete particulars, thus initiating the structuring of the many toward the whole.

For some people, under diverse circumstances this hidden background suddenly or gradually becomes foreground; and with this change one's world is changed. A new meaning emerges from the givenness of the manifold. What heretofore signified the mere adjacency of diverse particulars now is seen as the partial manifestation of a single whole, which constantly reveals and conceals itself in the many appearances.

## II

In the Western tradition perhaps the first intellectual response to this experience, of which we have some record, might be that of Thales. Perhaps he expressed himself feebly, and in an unconvincing way when he claimed that all things were made of water. There are several shortcomings of this formulation, if the claim that it is an attempted response to that unitive perception which has in its full-blown forms become formulated as monism is correct. Firstly, the naming of the ultimate as water, while it is intelligible, is a mistake, because to the unreflective listener it somehow suggests the

primacy of the familiar form of water. Only on reflection does one realize that if everything is water, the familiar transparent liquid has no priority over the appearance of water as rock or plant, or human body. Each of these, alike, is but a form and only one form of water. Thus the negative formulation of Anaximander, namely that the underlying unitive source is the boundless, the unspecific, the *ἄπειρον*, is a considerable improvement over Thales.

The second shortcoming of Thales' formulation lies with the implication that the unitive ground is explicitly in the domain of the material, the objective—for after all is said and done, water, in whatever shape or texture it presents itself to us will seem, once again to the unreflective disciple, as an extended entity. And thus the underlying unity of the manifold will be conceptually appropriated as "matter."

Yet, those who have paid closer attention to the experience of the coherency of the manifold recognize that this coherency embraces not only things, objects, entities, and bodies, but integrates with these one's own consciousness with all its modes, and intentionalities as well as its subject-pole.

Here are Plotinus's words:

When the contemplative looks upon himself in the act of contemplation he will see himself to be like its object. He feels himself to be united to himself in the way that the object is united to itself; that is to say, he will experience himself as simple, just as it is simple.

Actually we should not say "He will see." What he sees, in case it is still possible to distinguish here the seer and the seen . . . is not seen, not distinguished, not represented as a thing apart. The man who obtains the vision becomes, as it were, another being. He ceases to be himself, retains nothing of himself. Absorbed in the beyond, he is one with it. . . .

Therefore is it so very difficult to describe this vision, for how can we represent as different from us what seemed while we were contemplating it not other than ourselves, but perfect at-oneness with us?<sup>1</sup>

### III

The individual who has gained this new and less frequent way of being in the world, in which the world and one's own being in it dislign their separateness, finds it his task to formulate, to speak the meaning of his experience. He has available to him only the language gained in the earlier pluralistic mode of experiencing.

Obviously his speaking is to be oriented mainly toward those whose experience is still pluralistic. The aim of speaking is not merely to assert; it is to create, to bring about in the listener that transformation of consciousness which will permit the emergence of the new, holistic mode of apprehension. What is at stake is not merely assertion or description—rather it is the modification of that basic reality principle in the listening perceiver which will permit him to renounce that innocence which takes the presented multiplicity of the world and himself as ultimately real in its manifoldness.

Once the new speaking is formulated, it focuses attention on those unobtrusive but present clues in the manifold whose paradoxical and special character can be made paradigmatic and universalized to provide persuasion for the learner to seek the new perspective. For example, in the *Chāndogya Upaniṣad*, Svetaketu is invited by his father to consider dissolved salt as the now invisible yet all-pervasive presence in brine, giving it its characteristic properties; just so the invisible all-pervasive is what the seed conceals to account for its capacity to become the mighty tree—and so—almost as a poetic refrain the father teaches that “that art thou, also, Svetaketu”—*TAZ TWAM ASI*. And so the self-other chasm is bridged—nature

and person, God, world and man are seen to have the same identity.

In the Neoplatonic tradition as well, the unitive experience invites the experiencer to express in speculative metaphysical or theological language, or in poetic metaphor the significance and the persuasive, illuminative character of the new consciousness. Clearly the demand is to use the available conceptual framework, and yet so to modify it as to intimate the drastic novelty of what was formerly the manifold, and is now only a visible token of the One whose unity both contains all distinctions, and is beyond any distinction.

In the Indian tradition this paradox gives rise to the need for a doctrine of two truths (*samvṛtti* and *paramārthas*). The aspect which sees that all distinctions are but distinctions of the One is a correct aspect, and yields a set of true claims—whose truth, however, is logical, perspectival, practical (*samvṛtti*). The other sense, which recognizes the One to be beyond all distinctions is not itself a perspective, but is beyond perspective, including them and transcending them. A different family of knowledge can be gathered here, more akin to wisdom, which sees the One as the unknowable source of all knowledge, to which the only sound relationship is one of reverence rather than intellectual appropriation, but which nonetheless manifests a converse relation to the reverencer—namely, love.<sup>2</sup>

Instances of useful imagery from the world of natural objects recognized as paradigmatic are the sun and the overflowing wellspring.

The effulgence of the sun, as it beams its own substance into the void not only makes the visible world visible; it makes the visible world, in the sense that the sun coaxes the seed into the plant, hatches the fly and the mosquito; creates living rills which flow refreshingly from the frozen mountain tops. Thus the sun is the source, but remains what it is. And yet there is the dread contrast—the sun delights the eye that beholds the visible—yet blinds the eye which would behold the sun. In both Western and Indian thought these aspects of

the experienced world were not only recognized but utilized as archetypal for metaphysics and theology.

Similarly consideration of the overflowing wellspring, which feeds its environs with water, yet remains filled to the brim, was to invite the attention of the listener to a way of conceptualizing the relationship between the One and the many.

In this way doctrines of creation, which are conceptually pluralistic, radically separating the maker from the made were replaced in the unitive traditions by doctrines of emanation, playful self-revelation-cum-self-concealment in the temporal flux of the mutable, which sometimes gained expression as pantheism, but more often, in the more articulate formulations as panentheism.<sup>3</sup>

#### IV

But for the critical inquirer a problem remains. The unitive vision is no doubt an experience, and perhaps, even a self-certifying one. However, while one remains in a critical stance the question arises as to whether the unitive vision is a positive transformation of consciousness, an advance, a growth, a veridical insight, or whether it is a pathology, a decay of the original reality principle, an ailment in whose grips differentiations so useful to and so necessary in what is known as practical life, cease.

A positivist approach to the resolution of this dilemma is in principle impossible. The very criterion in terms of which one would favour the unitive or pluralistic alternative is already based on one or the other of these presupposed—thus being incapable of serving as the basis for decision.

It seems, therefore, preferable to recognize that the unitive experience is, like the more primitive (in a sense of earlier rather than a pejorative sense) pluralistic perception, a potentially useful and important one, which, however, could invite unsound, unbalanced responses from which counterfunctional practical inferences could be drawn.

In order to approach our problem of whether the unitive vision is veridical or deceptive I shall sketch briefly a theory of experience, which I cannot here defend—it will be merely outlined.

All experience has a two-fold nature as experience. There is that aspect to which the experiencer is fundamentally passive, and that aspect, which is the constituting interpretive one, to which language and idea make their positive contribution, and in which the experiencer is actively and responsibly involved. Of course each of these aspects, the passive and the active, are but analytic fictions. Neither has its own independent reality. It is nonetheless interesting to separate the unity of experience into these two aspects.

I would like to propose that that aspect of experience to which man is fundamentally passive, the raw, pre-constituted datum (as stated above, this is an analytic fiction and has no independent existence) is beyond being true or otherwise. It simply makes no sense to give to this component of experience two truth-values—it simply is what it is.

On the other hand, the responsive, interpretive component, which secures the meaning of the raw "datum" is what can be true or false. If this be granted it follows that the given aspect of the unitive vision is beyond the question of truth or falsity, while the interpretive-responsive aspect has potentially or actually flawed constituents.

Our method, then, will be the exploration of the varieties of responses to the unitive perception, along with the rejective arguments of the critics, and the use of our own intuition, which must be reflectively consulted in order to arrive at some tentative resolution of the dilemma of whether the unitive vision is a progression or pathology of consciousness.

Monistic metaphysical speculations have often yielded a kind of indifference to the manifold, and, its critics maintain, a consequent dissociation from involvement with issues of significance to human well-being. The critics contend that the unitive vision is dysfunctional because it promotes callousness and lack of concern. If the world of injustice and suffering is

dismissed as mere illusion and deception by the monist then the critics are sound in their objection, since the experience of moral indignation and duty are based on a categorical, that is, unconditional, imperative.

But while on occasion monism has in fact led to indifference and callousness, it need not do so. There is a subtle but significant contrast between equanimity and indifference. The more persuasive monists have made it clear that although the manifold is not ontologically many, as it is supposed by the pluralist, it needs to be taken seriously, that is, with compassion, concern, joy and zest.

In such a brief account as the present one it is impossible to resolve the question about all monistic philosophies and theologies once and for all. There are too many variations of monism for each to be equally adequate and true. But there is value in the monistic vision, exactly because it provides a thoroughly sustaining basis of meaning, a strong and invulnerable sense of identity which can weather the vicissitudes of fortune and circumstances. And even though occasionally there are instances of extreme withdrawal from the issues of the manifold by the contemplative, there have also been thoroughgoing examples of heroic and invincible creative involvement with them, in which "holy indifference" in the service of the Divine (St. Ignatius) or "bhakti" was the fundamental descriptive of the meaning of the involvement, whose nature coincided in its fullest sense with the most dedicated benefaction.

Thus, devotion to and reverence for the One, even when that One is beyond good and evil<sup>4</sup> has yielded that intense longing for identification with and realization of the good, which overcomes the above objections, leaving the unitive vision coincident with this important touchstone for truth.

The fact that the intellectual problem of how and why separation from the good, or the One (even if it is merely an apparent separation), is possible, and in terms of what principle can the increasing or decreasing distance of separation be measured or felt, is another criticism of the metaphysics of

monism. This has to our knowledge and satisfaction never been resolved adequately by purely intellectual processes; and consequently has been dealt with by those with the monistic perspective as a demonstration of the limits of intelligibility.

In the Aristotelian tradition, as well as the Hegelian one, rational intelligibility has been a condition of being; but that this must be so has not been adequately demonstrated. To the contrary, the monistic tradition claims that intelligibility is a condition of being *limited* and hence evidence not of being, but of lying in the shadow of distance from being;—even if how that is so cannot be understood. This is why for Plotinus *nous* is not identical with the One but already derived from it, involving some sort of necessary duality in intellection in spite of the immediate contemplative grasp of the unity of being.

Thus, while we can't make the reason and process of multiplicity and separation intelligible in the classical or the Indian monistic traditions, a second-order intelligibility is achieved by exposing the dualism, and hence limitation, of intelligibility, denying its being the essence of being. Consequently the problematic character of the multiple or manifold remains.

## V

It is the contention of the present paper that it is possible to respond to the unitive vision not only in terms of metaphysics and theology, but also in terms of a critique of modern science which in turn retains its scientific and meta-scientific character. While in fact the phrases "systems-research" and "systems-science" are far too broadly used to be indicators of the presence of this transformed perspective of the manifold, it is our contention that at the root of the systems approach to the sciences lies the unitive vision, even if, on occasion, it is less explicitly expounded.

We have to examine two fundamentally related yet distinctive notions—namely, the systems approach to the sciences, and general systems theory.

The systems approach to the sciences is the consequence of the discovery that the discrete disciplines, with their respective special analyses of what seem to be causal structures have left out significant aspects in their tendency to reduce explanations to causal chains. Rather, it has been seen that in addition to the primary interactions, often interpreted as causal chains, there are weaker, less perceptible, but nonetheless significant interactions among other aspects of the whole, which for human purposes play determinative, or at least important roles.

Ecosystems, feedbacks, information exchange, cybernetics, and in general, the recognition of the complexity of wholes in their interdependence and interactions with parts has been the consequence.

Thus arose the need for a new science, a new study, which has both mathematical aspects and empirical ones, called general systems theory. This is the science of the study of wholes, or wholeness. It is an attempt to provide abstract models of what it means to be a part, what is differentiation, what is identity, what is the significance and the possibility of independence, of a closed system, and, in contrast, an open system.

Of course such studies can be undertaken and are being undertaken from the pluralistic perspective. Many authors in the field talk about "wholes" in the plural, or are prepared to consider isolated, situational complexes as "a closed system."

But it seems to me that some of the serious studies of wholes can and will go beyond pluralism, and provide a scientific language for responding to and describing the unitive vision. Most importantly, it is recognized and accepted that every system, every whole which can be considered intellectually, is embedded in a matrix with which it is interdependent. Thus the boundary, the differentiation between the whole and its matrix is not an absolute isolating "skin," but,

indeed, much more like the organic skin, a locus of interaction, which nonetheless can serve as a demarcation line because the quantitative and qualitative aspects of the interactions among elements and complexes within the demarcation are distinctive from those which take place across the demarcation. This type of insight enables us to get a better conceptual grasp of how it is possible to have differentiation, distinction, contrast, without being absolutely different, or having an autonomous separateness. Furthermore, if, by definition, we recognize that every system which is deemed "closed" is nonetheless embedded in an environment which does have some influence on the system, then we recognize that the notion of a "closed" system is an idealized structure, which may be considered for practical purposes, but can never *be*.

So far our description of systems science and systems theory is pretty inert, thoroughly comprehensible in merely material and objective terms. This is misleading. The claims made transcend the notion that whatever is, is embedded in a larger chunk of the material and natural universe. Rather, what is involved is the seeing that the natural universe as such is embedded in a system of language, and of judgment, a system of perception, and of evaluation, whose one aspect is measurement. These in turn have cultural contexts, with all the values and history that that entails. Now, these in turn may be deemed to be embedded, bounded by aspects of the natural world. And so we come to the seemingly paradoxical notion of mutual embeddedness. At this stage complementarity and the psychological flip-flop of foreground-background reversions of perception can come to our aid.

But then, these mutually inter-embedded quasi-wholes, the natural world, and the conceptual-mental-linguistic-cultural world, for which the German language has an adequate term—"Geistlich"—are themselves embedded—but in what? Here we come back to the theme of our conference—and a joint insight from general systems theory and Neoplatonism. The ultimately embedding matrix is beyond the knowable.

And yet the knowable interacts with it, and ultimately depends on it.

One must be warned that interaction need not be conceptualized as causation. That is just a tendency of individuals socialized in one particular intellectual tradition. Creation, emanation, inspiration, information are other conceptualizations of interaction. But one needs also to remind oneself that caring, loving, longing, and abandonment are forms of interaction as well. Nor do all of these collectively exhaust either the species or the types of interaction possible. Furthermore, every interaction has a converse; and the converse of an interaction is like its original only if the interaction is symmetrical.

Hartshorne has convincingly demonstrated the primacy of asymmetry.<sup>5</sup> Hence it can be shown that the dependency of the intelligible realm upon its embedding One is not mutual. The embedding One clearly can and needs must have relationships not only with the system "the intelligible domain," but with each of its subsystems, and each of the elements thereof. This is the most abstract, yet most persuasive conclusion from general systems theoretic considerations.

## VI

It thus remains for us to conclude the paper, and review its claims.

In the first section we argued that the originary way of being-in-the-world for all men has a fundamentally pluralistic dimension in the foreground, while, inadvertently, even then an integrative, unifying background introduces language, the initial organizing principle. We have also suggested that in some cases, for reasons not well understood, there seems to come a reversal of focus, centering on the integrated and holistic character of every apparent contrast—especially the self-other, world-man, God-nature ones. This transformation of consciousness through the emergence of a new meaning

perceived in the manifold calls for a phenomenology; it is an invitation to say the meaning of being.

In the second section we considered Thales' notion that all is water, as a first and not quite adequate attempt to respond to the experience of the unitive vision, showing some of the requirements of a more adequate response.

In the third section we discussed the role of archetypal analogies from the realm of ordinary experience, asserting that the function of speaking is not merely to make truth claims, but to mold, transform the consciousness of the listener. Thus, there is a proselytizing character even to the apparently most descriptive of monistic metaphysics or theology. We then raised the critical question as to whether or not the unitive vision is an advancement or a deterioration over the pluralistic way of being in the world, and while we were sympathetic to certain kinds of criticism with respect to some of the interpretations of the significance of the unitive vision, we indicated that such interpretation is not an essential or necessary consequence thereto.

While the problem of apparent separation and a principle of distance from the One has been left plainly unresolved, it has been shown that this conundrum does not invalidate the powerful formative effect of the transformation produced by the unitive vision.

And finally we have shown that response to such an experience can, in contemporary times, take on a new form of expression, emerging as a critique of conventional science. It has also been suggested that the careful study of wholes and boundaries in terms of a systems-approach will reveal a structure of being very close in character to Plotinus's metaphysic, in which the ultimately embedding One is not itself intelligible, but upon it depends each and every aspect and constituent of every embedded whole, or system; whether understood as "closed" or "open."

## Some Critical Conclusions

---

I. C. Sharma

*Cleveland State University  
Cleveland, Ohio*

This concluding article aims at clarifying the implied conclusions of the contributors. In order to do justice to the analysis of the ideas presented by all the scholars, it seems necessary to give a very brief nonpartisan view of Indian thought, based on the study of original sources which have not so far been translated into any Western language. Almost all the aspects covered by the participants in the Seminar and published in this volume, refer to those aspects of Indian philosophy which have direct or indirect connection with Vedic thought. I would therefore begin with the exposition of Indian thought, with reference to the *Vedas* and *Upaniṣads*, which are the perennial sources of the Indian tradition.

In order to throw sufficient light on the epistemological method of the *Vedas*, it is important to state that two types of knowledge have been accepted by the Vedic seers, viz.: (1) *Vijñāna* (scientific knowledge), and (2) *Jñāna* (comprehensive knowledge). The word *Vijñāna* is the combination of *Vi* + *Jñāna*. *Vi* means "plurality, individuality, and changeability."

*Jñāna* literally means "knowledge, awareness and understanding," but in this context, it has to be understood as "innermost knowledge." Hence, the entire metaphysics of the *Vedas*, which later on is elaborated by the *Upaniṣads*, the *Bhagavadgītā* and the classical systems, has two aspects. The *Vijñāna* aspect is concerned with the pluralistic nature of particularities and the changeable nature of the universe. The *Jñāna* aspect is connected with the innermost unity behind the diversity. The two trends in the *Vedas* are called *Mantra Vidyā* (science of unity), and *Yajña Vidyā* (science of plurality). The *Mantra Vidyā* is also called *Mūla Vidyā* (science of the root), and *Yajña Vidyā* is called *Tūla Vidyā* (science of explanation). Further, *Mantra Vidyā* is designated as *Brahman Vidyā* (the science of ultimate Being), and *Yajña Vidyā* is called *Brāhmaṇa Vidyā* (science of cosmic processes or forces).

The Vedic metaphysics, therefore, is both monistic and pluralistic, unitive and divisive. The unity concerns the innermost ground and the diversity is associated with the extended pluralistic cosmic reality. The unitive philosophy is a matter of recognition and realization, termed as *Darshana* (seeing). The pluralistic reality is a matter of actual behavior, practice and grappling with the environment, termed as *Varttana*. This thought has been summed up in the statement "*Samadarshna* and *Vishamavarttana*," i.e., "unitive philosophy and differentiative behavior." By differentiation is meant the acceptance of the differences between the subject and object, self and environment. Wherever the word *Drṣṭi* (seeing) has been used in Indian thought, it refers to *Drashtā* (seer, the self). Wherever the word *Varttana* is used, it refers to a concrete situation of reciprocity between the unitive self and pluralistic environment. This ethico-metaphysical characteristic of Vedic thought pervades the history of Indian philosophy from the ancient to the modern times. That is why all the classical systems are unanimous in basing their views on the Vedic authority.

The other concepts which need clarification are those of *Brahman* and *Ātman*. The word *Brahman* cannot be translated exactly. It has been suggested that *Brahman* is that which expands, because the term *Brh* means "to expand." This would be a wrong translation, because the *Vedas*, the *Upaniṣads* and the *Bhagavadgītā* refuse to accept *Brahman* as an activity itself, though all activity is due to *Brahman*. All three sources of Indian thought referred to here are unanimous in accepting the fourfold nature of *Brahman*: (1) *Avyaya Brahman* (the eternal infinite ground of all, not even One); (2) *Akṣara Brahman* (the indestructible One, absolute cause); (3) *Ātmakṣara Brahman* (the supreme self, endowed with the potentiality of creation, preservation and destruction, and hence a creator, not yet differentiated in subject and object); and (4) *Viśvasṛṣṭ Brahman* (cosmic form, the pluralistic world of galaxies, super galaxies and individualities as an irradiation of just one spark of the supreme self). It is noteworthy that *Avyaya Brahman* is not even One or a unity. In this sense, the One of Plotinus may be closer to *Avyaya*, though not exactly identical with it. The *Avyaya* is also called *Parātpara* (beyond the beyond). *Akṣara* is the absolute indestructible cause. It is the One unmanifested, potential cause, which at the next stage becomes *Paramapurusa*, *Ātmakṣara* (the supreme self, or literally, the supreme person). It would be erroneous to entertain any anthropomorphic idea of a person here. The literal meaning of *Ātmakṣara* is "self-limitation of indestructible reality." Comparison can be misleading. It cannot be identified with the world soul, nor completely with Nous. It is more Nous than world soul. It is an irradiation from *Akṣara Brahman*, which is both One and the Nous as a potentiality. This explanation would give the reader an idea why many Upaniṣadic passages appear to be contradictory, though they are not so.

The Vedic and the Upaniṣadic *Brahman* are identical on account of this fourfold nature: the ground, the cause, the supreme self, and the cosmic form.

*Ātman* (the self) or *Puruṣa* (man) is exactly a miniature *Brahman*. The fourfold nature of man has been stated to be the sum of *Ātman* (pure being), the *Buddhi* (the causal self), the *Manah* (the creative psyche—mind), and *Śarīra* (the physical body with sense organs and organs of action). The gradation in the case of *Brahman* from *Avyaya* to *Viśvasṛiṣṭ* is from subtle and most fundamental to less subtle and dependent. In the case of man, called *Adhyātma*, the gradation is from the most subtle to the most gross. Based on this fourfold cosmic metaphysics and human nature, are the fourfold social, ethical and philosophic systems in the *Vedas*, the *Upaniṣads* and the *Bhagavadgītā*. Unlike Plato, the social system in the Vedic tradition is not threefold, but fourfold, because of the spiritual, the intellectual, the mental, and the physical aspects. The fourfold values parallel to Platonic virtues are *Artha* (economic value), depending on temperance; *Kāma* (love), depending on courage and temperance; *Dharma* (ethical duty), depending on justice and courage; and *Mokṣa* (spiritual perfection), depending on wisdom. The *Upaniṣads* also state the fourfold nature of knowledge, based on the four levels of *Jāgrat* (waking consciousness); *Svapana* (dream consciousness); *Suṣupti* (deep sleep consciousness or unconsciousness); and *Turiya* (supra-consciousness, associated with the spiritual self, the causal self, the mental self and the physical self, respectively). The word *Cit* (consciousness) applies both to waking and dream consciousness and the word *Acit* (unconsciousness) as the ground of *Cit* (consciousness), is not to be understood as devoid of consciousness. The word *Turiya* is beyond the concept of *Cit* and *Acit*. Incidentally, Plotinus's gradation of the stages from the physical to the level of the One, so far as soul's journey back to the One is concerned, seems to be parallel to this hierarchy.

The detailed discussion of the fourfold nature of *Puruṣa* in the *Bhagavadgītā* is given in the article "The Plotinian One and The Concept of *Paramapuruṣa* in the *Bhagavadgītā*." However, it seems important to mention that the philosophy of the *Bhagavadgītā* propounds four, not three paths, as it is

commonly believed. These four paths or the methods, the *Yogas*, of attaining enlightenment are: the *Buddhi Yoga*, corresponding to the spiritual aspect of man (the *Buddhi* here may mean *Nous*, which is closer to the One); *Jñāna Yoga*, corresponding to the intellectual or rational aspect (*Jñāna* and *Vijñāna* as explained earlier, are combined in this path); *Bhakti Yoga*, corresponding to the mental aspect; and *Karma Yoga*, corresponding to the physical nature of man. It is pertinent to point out that the first six discourses of the *Bhagavadgītā* are devoted to the *Buddhi Yoga*, the seventh and eighth discourses explicate the *Jñāna Yoga*, the ninth to twelfth discourses explain the *Bhakti Yoga*, and the last six discourses expound the *Karma Yoga*.

On account of want of space and the propriety of not crossing the limits of the universe of discourse, it would be desirable to confine an introduction to Indian thought to the presentation given above. However, any comments and questions would be welcomed for further clarification.

The thought of the *Bhagavadgītā* is closest to that of Plotinus so far as metaphysics, ethics and epistemology are concerned. Both the *Bhagavadgītā* and Plotinus accept contemplation (*Yoga*) as the method of salvation or the union of the individual soul with the One. The *Bhagavadgītā*, as has been stated already, regards the way of intellect (*Buddhi Yoga*) as the highest technique. Plotinus likewise advocates contemplation. Whether Plotinus's meditation precedes his metaphysical system, or the formulation of the metaphysics precedes meditation, is not of academic significance. The truth is that he asserts that meditation does lead to the union of the One. The *Bhagavadgītā* clearly emphasizes that this *Yoga* or union of the individual soul with the indestructible One, ultimate *Brahman*, requires contemplative knowledge of the Truth, including the realization of It in the pluralistic universe as well as constant contemplation of the One. It is also advocated that once perfection or God-realization has been attained, there is no rebirth of the soul. The soul attains its highest abode. It is beyond all limitations of time, space

and causality. In the eighth discourse of the *Bhagavadgītā*, it is stated that all the individual beings become manifest or actualized, because their matrix is unmanifested. The entire host of beings is cyclically manifested and merged back into their source. But higher than the unmanifested source (Plotinus's second hypostasis) is another essence, which is subtler than the subtlest and which is not destroyed even when all manifested beings are destroyed. This unmanifest, indestructible essence is called the ultimate abode.<sup>1</sup> Attainment of that abode means salvation.

The first paper, "Indian Wisdom and Porphyry's Search for a Universal Way," by Dr. O'Meara, is concerned with salvation in the sense of ultimate abode. It highlights many philosophical parallels and historical data with reference to the closeness of the Greek and the Indian culture. The author quotes Saint Augustine to emphasize that Porphyry was aware of Indian thought and culture. It may be recalled here that the quotes from the Greek and Roman sources, including Megasthenes, constantly refer to Gymnosophists. The word Gymnosophists is a variation of the Sanskrit words *Jaina Muni*, i.e., "Jaina monk." It is true that Jainism was popular in India at that time. However, Megasthenes used the term Gymnosophist both for the Vedic philosophers, the Brāhmaṇas, and the Jaina and the Buddhist ascetics, Śramaṇas.

The quote from Megasthenes referring to the similarities between Greek thought and the "first principles operating in the universe" held by the Indians at that time, is most pertinent. It clearly refers to the philosophy of the *Upaniṣads* and that of the *Bhagavadgītā*. Reference to God (*Brahman*) as light, which is discerned by the enlightened sages, again shows the acquaintance of Megasthenes with the *Upaniṣads* and the *Bhagavadgītā* at least indirectly. The *Mundaka Upaniṣad* says:

There the stainless and invisible *Brahman* shines in the highest golden sheath. It is pure; it is the light of lights; it is that which they know who know the self.<sup>2</sup>

In the *Bhagavadgītā* as well, *Brahman* is designated as "the light of lights", which illumines everything that exists."<sup>3</sup> These facts, combined with the direct or indirect evidence of the mutual exchange between the cultures of Greece and India, are corroborated historically from both sides. Since the philosophies and theories of the then India have been alluded to in Greek sources, it is possible that more evidence in this regard could be collected by the scholars. Professor O'Meara's effort to throw light on the parallels, both philosophical and historical, opens new fields for further investigation.

The next two papers, "Plotinus and the *Upaniṣads*" by Dr. Hatab and "Proclus and the *Tejobindu Upaniṣad*" by Dr. Rosán, are necessary for the proper understanding of Neoplatonism and Indian thought. Dr. Hatab has drawn inspiration from a wider range of *Upaniṣads* with a view to removing some misunderstandings about Plotinus and Hinduism. He has made an attempt to point out that it would be erroneous to hold that the world is an illusion, either according to the *Upaniṣads* or Plotinus. In this connection, our previous observation about the concept of *Brahman* in its four aspects, as depicted in the *Vedas*, further supports Dr. Hatab's viewpoint.

Dr. Rosán's approach is phenomenological. It should, however, be remembered that *Tejobindu Upaniṣad* is just one of the *Upaniṣads*, which are all unanimous in the acceptance of immanence as well as transcendence of *Brahman*. Three *Mahāvākayas* (universal statements, not litanies) are accepted as fundamental truths in all the *Upaniṣads*. These *Mahāvākayas* are: "Sarvam Khalvedam Brahman," i.e., "everything indeed is *Brahman*"; "Brahman Satyam Jaganmithya," i.e., "*Brahman* is the (final) truth and the world (in comparison with pure *Brahman*) is false"; and, "Aham Brahmasmi," i.e., "I am *Brahman*." Keeping in view the immanence of the *Brahman*, those statements in *Tejobindu Upaniṣad* are true, which refer to the identification of the utterer with the spatio-temporal aspect or *Viśvasṛṣṭi* aspect of the *Brahman*. Wherever the self is identified with the transcendental (*Avyaya*) aspect, *Parātiparu*

(beyond the beyond), then by contrast, it is justified to regard everything other than the infinite *Brahman* as false. The *Mahāvākya*s are philosophically arrived at and experientially realized utterances or universal statements. *Tejobindu Upaniṣad* is not an exception. It differs from phenomenology, because the reality expressed therein is not within the parentheses like the subjective experience of the phenomenologist. *Sat*, *Cit* and *Ānanda* stand for "infinite existence," "infinite consciousness," and "infinite bliss."

The word *Tejobindu* literally means "the point" or "drop of light," and even "beyond light." The oscillation between affirmation and denial of the relative reality, the extension (*Tūla*) of *Brahman* is not a contradiction, nor a subjective report. It is a philosophical observation of shifting attention from the immanent to the transcendental aspects of *Brahman* and vice versa. The first three aspects of *Brahman*—the ground, the cause, and the supreme self—have also been designated as *Anantam* (infinite), *Jñānam* (pure knowledge) and *Satyam* (pure truth), respectively. These aspects are transcendental in the sense that they are *Svarūpa Lakṣaṇas* or "the essential characteristics." The immanent aspect, being within the spatio-temporal and causal cosmos, is the irradiation of the first three. In the cosmic immanence those very three transcendental characteristics are self-limited and become *Sat*, *Cit* and *Ānanda* in limited form. The utterance of "I am *Brahman*" is philosophically justified when the utterer identifies himself with *Sat*, *Cit* and *Ānanda* at one time and with the transcendental characteristics at the other. The *Tejobindu*, "the point" or "the drop of light," when merged into the ocean of light (*Brahman*), does not lose its identity. It does not literally merge into the ocean, but becomes the ocean itself. Phenomenology is limited to the state of becoming, the manifest, whereas Upaniṣadic thought explains the relativity of the manifested reality in the context of the unbounded infinitude on both ends, unlike the bracketed phenomenological experience at the empirical level. The *Upaniṣad* of the *Bhagavadgītā* declares:

Unmanifest are the beings in the beginning, unmanifest are they at the end, they are manifest only in the middle; hence the death should not be lamented.<sup>4</sup>

The words "I am" in the context of *Tejobindu Upaniṣad* refer not to the ego, but to the unitive aspect of the self (*Ātman*). "I am" in an empirical sense has to be transcended and made one with the One. This unity again has to be termed not a monistic state, but a state of nondualism. The concept of nondualism is philosophic, and as such points to the consistency and logical validity of the self, which is both finite and infinite, immanent as well as transcendent, and cosmic as well as acosmic. These facts show that *Tejobindu Upaniṣad* cannot be reduced to phenomenology.

The next paper on "*Buddhi* in the *Bhagavadgītā* and *Psyché* in Plotinus," by Professor Armstrong and Dr. Ravindra, is fascinating. It has a very close affinity with my own contribution, entitled "The Plotinian One and the Concept of *Paramapurusa* in the *Bhagavadgītā*." Though these two articles are written independently, yet they may appear to be complementary when read together. Dr. Ravindra's explanation of the word *Buddhi* needs a little elaboration. The term *Buddhi* in the *Buddhi Yoga* of the *Bhagavadgītā* does not stand for discursive intelligence; it is exactly noetic in nature. That is why *Buddhi* is distinguished from *Manas* (mind). When *Buddhi* is mentioned as a product of *Aparā Prakṛti* (lower nature), classed with mind, sense organs and fivefold material elements, it pertains to the diffusion of *Viśvasrit Brahman* (psyche) in the spatio-temporal cosmos and the individuated souls (*psychai*). There is no confusion when *Purusa* is identified sometimes with *Aksara* (the indestructible) and sometimes with *Kṣara* (the destructible) aspects of *Brahman*. After all, *Viśvasrit Brahman* diffused in the cosmic form is the self-limitation of the supreme self.

The destructible aspect of the cosmic form, like that of the lower psyche, has been called *Kṣara Puruṣa*. The indestructible, the inner aspect, the immanent nature of *Brahman* (higher psyche) has been designated as *Akṣara Kūṭastha*. The third aspect, which is beyond *Kṣara* and *Akṣara*, has been called *Paramapurusa* or *Puruṣottama* in the *Bhagavadgītā*. The triad of the destructible, the indestructible and the transcendental aspects within the cosmic form is the replica of the transcendental triad of the ground, the absolute cause and the supreme self outside the spatio-temporal world.

The *Akṣara*, as transcendental, is exactly the *Nous* as the repository of all creation and the source of emanation of the psyche. In man, it is represented by the *Buddhi*, which is next to the *Ātman* (the pure self). The fourfold nature of man from this point of view has been summed up in the third discourse of the *Bhagavadgītā*:

The senses are subtle, subtler than senses is the mind, subtler than the mind is the intelligence and subtler than the intelligence is He (the pure self).<sup>5</sup>

In the *Buddhi Yoga*, intelligence is designated as *Prajñā*, (the irradiation of the *Nous* in man). It is noetic psyche. The concept of *Sthitaprajñā* is exactly the same as that of the "noetic contemplation" and the "ideal state of man... in which his individual psyche behaves as like cosmic psyche as possible," in the words of Professor Armstrong.

The word *Yoga*, therefore, may be translated as "noetic state of the psyche." If this is permitted, the parallel between the *Buddhi* and psyche, as depicted in this paper, is therefore most accurate.

The soul, which is in a unitive state of *Yoga*, which is pure self, which has conquered the lower self and the senses, and which has become (realized) immanent in all beings, is not bound by any kind of actions performed in life.<sup>6</sup> In the words of Plotinus, a man who is in a noetic state of contemplation would not be bound by the limitation of the physical world,

in spite of remaining active in practical life. The Sanskrit equivalents for a person who is in a state of noetic contemplation are: *Yuktah* (united with the One); *Sthitaprajñah* (stabilized in intellect); *Yogin* (practitioner of *Yoga*); *Tatparāh* (one absorbed in the Ultimate); etc.

The next paper is "Phraseology and Imagery in Plotinus and Indian Thought, Especially *Mahāyāna* Buddhism," by Dr. Richard T. Wallis. He agrees that "the resemblances between the accounts given by the mystics the world over" do exist, and yet he holds that a cultural contact is inapplicable to mysticism. The question is whether cultural contact, leading to the exchange of results of experiments in the area of science has any significance. I think it has a great significance, because comparative study of scientific theories and exchange of the results of experiments on the part of the scientists of different countries and cultures, has led to the development of science and technology for the benefit of humankind. Even if we rule out mutual influence of the Greek and Indian cultures, and in spite of the factual and historical evidence, the parallels between the results of mystic experience have no doubt a great philosophical and scientific signification. This significance is heightened by a comparative study of the *Bhagavadgītā* and Plotinian thought, especially in an historical context.

Here we may raise the question why religion, in spite of its universal appeal to love and humanitarianism, has, unlike science, lagged behind in commanding recognition. How is it that science and technology are more highly respected all over the world than religion, irrespective of caste, creed, nationality and race? Why do scientists the world over agree in the objectivity of scientific truth, thereby giving a base of unity to mankind, whereas religion seems to have caused dissensions and disagreements, leading even to bloodshed and wars in the name of God? Scientists are unanimous about the nature of the atom, but religionists have not come to any agreement with regard to the ground of religious experience—God. The

reasons may be a lack of cooperation, an absence of comparative study of religious experience, and a tenacious refusal to accept factual evidence of the mystics of the world as a possible hypothesis of an objective unanimity with regard to the nature of God.

Let us accept that Plotinus was absolutely ignorant of Indian thought. The question arises, what could be the cause of the parallelism between the meditative methods of Plotinus and those of the *Upaniṣads* and the *Bhagavadgītā*? How is it that similar methods have led to the same conceptual formulation in Plotinus of the theory of the One, the Nous, the Psyche and the World, as that of Indian thought? The most modest answer would be that, just as the scientists' experiments on the nature of the atom performed in different laboratories have led to the same conclusions, the Greek and Indian thinkers might have reached identical conclusions in the domain of religion independently of one another.

Comparative study of Neoplatonism and Indian thought seems to imply such an hypothesis. In order that this hypothesis is properly formulated, confirmed and verified, researchers in the East and the West shall have to be open-minded. They shall have to be prepared to sacrifice their narrow tendency of glorifying the individuality and integrity of the authors of philosophical systems in order to arrive at the objective truth. In the absence of such an attitude, explanations of the parallels, with a tendency to overrate one's own culture, are bound to be incomplete and self-contradictory.

This seems to have happened when Dr. Wallis suggests hesitantly that perhaps Plotinian thought influenced Buddhist thought, and even the thought of the *Bhagavadgītā*. There is ample evidence to prove the continuity of Indian thought from the Vedic through the *Upaniṣadic* period and the period of the *Bhagavadgītā* to that of the classical period. In this connection, it may be pointed out that the word *Dharmakāyā* (cosmical body), identified with ultimate reality, is a combination of *Dharma* and *Kāyā*, meaning "the law" and "body," respectively. The word *Dharma* has its origin in the

*Vedas*, where it means "the cosmic law and ground of all existence." Similarly, the observation about the statement of Maharishi Raman is not only anticipated by the *Bhagavadgītā*, but anti-postulated and explained in detail much earlier by the *Mantras*, the *Brāhmaṇas* and the *Upaniṣads*.

The paper "Meditative States in the Abhidharma and in Pseudo-Dionysius" by Dr. Rodier is very interesting. It has been well supported by relevant quotations and is thought-provoking. His analysis of the state of meditation from a comparative point of view further strengthens the hypothesis of a common ground of the experiences of meditative states. This analysis also points out that both the technique of meditation and the experienced states of it are verifiable and even demonstrable. Another important observation in this paper is that the purpose of the technique of meditation is self-purification. This observation has great importance, because a comparative study of Neoplatonism and Indian thought does incline us to this conclusion. This is true not only with reference to Buddhist thought, but also with reference to the Vedic tradition down to *Pātanjala Yoga* and Jainism, which is chronologically prior to Buddhism.

Followed by this analysis is the scholarly paper of Dr. John Borelli, entitled "Matter and Exemplar: Difference-in-Identity in *Vijñānabhikṣu* and Bonaventure." In fact, the approach of *Vijñānabhikṣu* would not appear to be different, as long as evolution of Vedantic thought as the continuity of Vedic thought is not lost sight of. 'Unity and plurality' in God dates back to *Rg Vedic* times, as it has already been stated in connection with the terms *Jñāna* and *Vijñāna*. It may be helpful to explain the meaning of the Vedic word *AUM* in this context. The letter *A* stands for origination, or creation. It is therefore indicative of the pluralistically creative power of God and is symbolized by *Brahmā* in Hinduism and 'The Father in Heaven' in Christianity. The letter *U* signifies evolution or preservation, symbolized by *Viṣṇu* in Hinduism and 'The Son' in Christianity. The letter *M* is associated with destruction of matter back into spirit, the function attributed

to and symbolized by *Shiva* in Hinduism and 'The Holy Spirit' in Christianity. Moreover, *AUM*, a syllable with the potentiality of the threefold function of God, is also the super-sound, called *Shabda Brahman*. It is equivalent to the word *Logos*, translated as "word" in the Gospel of John. It is stated that God was word and word became flesh, the Son. According to Hindu terminology, it could be said that the primal nature of God was word, as sound, *Aum*. It is from the sound that *U*, the Son, the *Viṣṇu*, the light of lights, emanates. It is the *Viṣṇu* aspect or the Son aspect that incarnates Itself in the human body, as an *Avatāra*. A Hindu would not only not object to universal Christ as the way to God, but would even emphasize that it is the only way.

The meaning of the universal Upaniṣadic statement "Aham Brahma Asmi" ("I am *Brahman*") needs little explanation in this context. This is only an hypothesis, a suggestion and an interpretation from a comparative point of view. Śrī Kṛṣṇa says, "I am the light of lights and the *Aum* of the *Vedas* and whosoever surrender to Me, comes to the ultimate abode." Jesus Christ says, "I am the way, the truth and the light." Is Christ referring to the "I" as his personal empirical ego, when he particularly jumps to the words "truth" and "light"? Can we not associate Jesus Christ with Moses, who saw the light (burning fire not consuming the bush) and who reported that the God he saw exhorted him to announce that His name is "I am that I am"? Is it not the same universal "I Am" (*Aham*), conveyed by Moses, which Jesus Christ repeats in his declaration of being the way, the truth and the light? The comparison again leads us toward the hypothesis of the sameness of the ground of experience of the Upaniṣadic sages, Moses, and Jesus Christ.

Dr. Paul Hacker's paper "*Cit* and *Notus*" may at first sight appear to be a note of dissent to our thesis. Emphases on conceptual differences between Indian thought, particularly what he calls Vedāntism, and Neoplatonism seem to have upset the author so much that he "was often tempted to renounce writing a paper to be read at the congress." In the

first half of his article he seems to be somewhat dogmatic in his assertion, "East is East and West is West." He also seems to exhibit an ambivalent attitude of praise and condemnation toward the so-called Vedāntism. His polemic in the earlier part of the essay is at times emotive, skeptical and even logically fallacious. He resorts to the fallacies of *Ignoratio Elenchii*, *argumentum et verecundum*, as well as *argumentum et hominem*. He first praises Paul Deussen as "the deepest specialist of Vedāntism in the West," and quotes his words as an authority to show that Śaṅkara is guilty of postulating "a subject without an object," though as already pointed out this is not the case. Later on, he says that Deussen, "the most specialized specialist[,] misunderstood the most central of the subject[s] of his studies." In this connection, it may be pointed out that Śaṅkara's system of Vedānta is *Advaitavāda* (Nondualism) and not *Aikyavāda*. It is so because subject as well as object, the dual aspect of the same *Brahman*, have been recognized. Dr. Hacker repeatedly admits that his polemic is directed only toward Śaṅkara's Vedāntism and not toward Indian thought in general. Even after using such a saving clause in his statement against Śaṅkara, he also says:

Vedāntism, far from being a pedestrian matter-of-fact philosophy, has developed such a pure and sublime concept of Spirit as no other philosophy, be it in India or in the West, has ever succeeded in discovering. I think it was an enormous achievement to abstract Spirit, not only from contents, but also from those elements that seem inseparably linked up with it to form that Ego or the subject of knowledge.

These words of Dr. Hacker, placed side by side with his allegation of "the monstrosity of an absolute perception" against Śaṅkara, show that the author is blowing hot and cold in the same breath.

This, however, does not minimize the importance of this most scholarly paper by Dr. Hacker from the comparative

point of view. Within the paradigm with which he starts, he has tried to demonstrate the logicity of his conclusions. His scholarship and the knowledge of the sources relevant to his paradigm are superb. I wish he could have included the other schools of Nondualism in his purview. Śrī Vallabhāchārya, the founder of Pure Nondualism of the Vedānta, declares that, to say "‘this world is an illusion’ is itself the greatest illusion." Keeping in view the continuity of Indian thought of which Śaṅkara's Vedānta is an integral part, the recognition of 'unity in diversity' cannot be lost sight of.

That Indian thought is not unaware of the unity and interpenetration of the three aspects of *Sat*, *Cit* and *Ānanda* in connection with the fourth aspect of *Brahman*, the cosmic form, does not need any elaboration. Dr. Hacker's contribution is no doubt unique. In spite of pointing out some differences of the interpretations of some metaphysical concepts of Neoplatonism and Vedāntism, he has strongly advocated that the comparative study of Neoplatonism has great value. Talking about the Indian triad of *Sat-Cit-Ānanda*, he observes:

I venture to submit that similarity between this triad, the Christian triad, Trinity, on the one hand as well as Proclus's 'Being-Life-Spirit' triad on the other hand, is no mere chance, but is grounded in reality.

This is a most positive statement, which strongly supports our thesis with regard to the significance of comparative study of mystical experience with reference to the nature of its Ground—*Brahman*, The One.

The next paper, entitled "Matter in Plotinus and Śaṅkara," by Dr. Francisco García Bazán, is being placed after "*Cit* and *Noûs*" so as to maintain the sequence of thought. This is a genuine scholarly attempt to bring out the parallel between Plotinus and Śaṅkara, so far as the nature of matter is concerned. The exposition of Plotinus's view seems to be more precise than that of Śaṅkara, because the author of the paper

admits that his approach is limited mainly to Śaṅkara's commentary on the *Brahma Sūtra*.

It would be pertinent to point out that for the facility of the reader, the word "conscience," used as the translation of *Cit*, should have been substituted by "consciousness," and the word "happiness," as the translation of *Ānanda*, by the word "bliss." Since Śaṅkara's writings are massive, it would not be fully justified to assert that he considered the world or matter as a mere "illusion" in the ordinary sense. He has stated a number of times that the world is not as unreal as "the son of a barren woman" or an imaginary "flower of the sky." The thrust of Śaṅkara's idea of transcendence is positivistic. In other words, when he speaks of *Brahman* as true and the world as false, he does not mean that the transcendence of *Brahman* negates the world. The world as relative reality is apprehended as such in comparison with the highest reality of the *Brahman*.

Śaṅkara has stated that the reality of the dream world is neither absolutely true nor absolutely false. As long as one is in the dream state, there is no doubt about the reality and concreteness of the experiences. It is only when one wakes up that in comparison with the waking experiences, one realizes that the dream was not concrete, but mental imagery. Similarly, the empirical plurality is real, though not absolutely real. When it is compared with the higher experience (*Brahmānubhava*), the world is apprehended to be an illusion. Hence, it is neither absolutely real nor absolutely unreal, but relatively real. It has been designated as *Sadasad Vilakṣṇa* (characterized by being and nonbeing). This nature of the world or matter is transcended only at the highest intuitive or contemplative level, according to both Plotinus and Śaṅkara.

Dr. Bazán's conclusive observation in this connection is most relevant:

In regards to the central and supreme intuition of both thinkers, a mystic nature stands out. In relation to their form of predominant discursive and

symbolic exposition and in relation to their mutual logical demands, their psychic, speculative and intellectual temperaments take on emphasis.

It is therefore implied in this paper that explanation of the parallels lies in the similarity of the mystic experience, the comparative study of which can throw light on the nature of its Ground.

Professor Hatton's paper is a comparative study of Śaṅkara and Eriugena on the question whether cause and effect must share any characteristics. The question is seen as a more general statement of the problem whether any term can be univocally applied to both Creator and creature or to both infinite being and finite being. Professor Hatton concludes that both Śaṅkara and Eriugena agree that in general, cause and effect need share no characteristics and thus in particular, that no term can be predicted univocally.

The next paper included in this volume is "Union with God in Plotinus and Bayazid" by Dr. Mohammed Noor Nabi, because it concentrates on the theme of mystic experience. Dr. Nabi has pointed out that ethical discipline as well is a means to the highest goal of union with the One and that in the case of Plotinus, this discipline means intellectual analysis, which is conducive, like ethics, to contemplation on the One. The comparative study of Muslim mysticism with Plotinian mysticism further indicates the universality and objectivity of the ultimate reality.

The next two papers concern the intellectual and philosophical similarities and differences between Neoplatonism and Śaṅkara's Vedānta. These papers are "Advaita Vedānta and Neoplatonism" by Dr. R. K. Tripathi and "The Concept of Human Estrangement in Plotinism and Śaṅkara Vedānta" by Dr. Ramakant Sinari. Dr. Tripathi has followed a typical approach of a closed Śaṅkarite and concluded that "Neoplatonism has to be regarded as an absolutism of [an] Advaitic type." In spite of the fact that this approach overlooks the

general and unbiased interpretation of the Upaniṣadic philosophy, it pretends to represent Indian thought as an absolutism. The tendency of overlooking the differences between the Nondualism of Śaṅkara and Neoplatonism limits the scope of the paper. However, it does point out the parallels which are indicative of the commonness of mystic experiences of Plotinus and Śaṅkara.

Dr. Sinari has adopted a modern comparative approach. He has compared the two philosophies from an existential point of view as well. On account of the existential paradigm, Dr. Sinari observes that the design of the thinkers of the *Upaniṣads*

was to capture the transphenomenal foundation of our being in the world and to map out the entire urge for transcendence we feel while we are still submerged in worldliness.

This may be partially true, even though, in light of what has been stated earlier, this view is not truly representative of Indian thought. To say that "Śaṅkara's transcendentalism is ostensibly 'world-rejecting'" and that "Śaṅkara annuls the very reality of the world" is not correct. However, the comparison in this paper is thought-provoking.

The next paper, by Dr. Priti Bhusan Chatterji, entitled "Plotinus and Śrī Aurobindo: A Comparative Study," is very interesting and academically important. It deals with the Neovedāntic philosophy of Śrī Aurobindo as a counterpart of Plotinian philosophy. Dr. Chatterji contends that just as Greek philosophy is summed up as a confluence in Plotinus, similarly Śrī Aurobindo's philosophy integrates East and West and yet remains original. The comparisons in the paper are striking and significant. The conclusion that the One, the Unique and the Transcendental are known intuitively, is quite in keeping with the general trend of all the viewpoints presented in this volume. In the next paper, "The Influence of Indian Philosophy on Neoplatonism," C. L. Tripathi notes some striking

similarities between certain Neoplatonic views and certain doctrines found much earlier in the *Upaṇṣads*, considers the question of whether some of Plotinus's views are of Indian origin, and finally discusses whether they first appeared in India or Greece. The next paper, "A Survey of Modern Scholarly Opinion on Plotinus and Indian Thought," by Dr. Wolters, is self-explanatory. In light of previous remarks presented in this volume, it needs no further comments.

The concluding paper, by Dr. J. R. A. Mayer, entitled "Neoplatonism, Indian Thought and General Systems Theory," is a beautiful contribution to this volume. That this article seems to sum up the findings of all the scholars who have contributed the foregoing papers is evident from the very title chosen by Dr. Mayer. A careful reading of this essay would incline the reader to conclude that the comparative topic of Neoplatonism and Indian thought is not only informative, but also most valuable for the future of philosophy and science. Dr. Mayer has raised questions about knowledge, metaphysics and mystic experience and has answered them without any ideological bias or philosophical preoccupation of mind. His analysis is logical, and his language chaste and appealing.

Dr. Mayer points out that neither pluralism nor monism can totally be rejected and that the empirical value of the former and the enlightening character of the latter contribute to the wholeness of truth, which science, philosophy and religion, analysis, intellect and intuition seek to investigate.

Though the paper is general—encompassing epistemological, metaphysical, phenomenological, mystical and logical implications of the main theme of this volume—yet it does point out that the intuitive experience of the underlying reality at the base of plurality has "the powerful formative effect" and that "responses to such an experience can in contemporary times take on a new expression, emerging as a critique of conventional science." Professor Mayer's view that monistic metaphysics, in which the ultimate One, though itself unintelligible, is

the ground of every embedded whole or system, is commendable.

A word to sum up the unitive theme and diversified approach of all the contributors to the study of Neoplatonism and Indian thought seems to be a part of my duty. As the reader will notice, the areas chosen by the contributors range from historical to metaphysical, logical, ethical, mystical, epistemological, phenomenological, pragmatic and even comprehensively evaluational aspects of the problem.

A thread of unity, suggested by the hypothesis that the parallelism of expression and the technique of attaining the unitive experience of the One in Plotinus, *Brahman* in Indian thought, and God in the case of all the mystics the world over, seems to run through all the articles. Every author has made a unique contribution. The volume itself presents a "unity in diversity" and "harmony in discord." Its philosophical importance does not need to be elaborated. Professor R. B. Harris must be congratulated as the initiator of the contemporary revival of interest in Neoplatonism, which seems to be the only philosophy that can bridge the artificial gap between the Eastern and the Western traditions of philosophy. I hope that the comparative study of Neoplatonism with other areas of philosophy, science, religion and psychology will perhaps lead to a better understanding of various disciplines. This is a most laudable philosophical venture.

## Preface

The essays of this volume provide a sampling of the significance of Neoplatonism in Western philosophy and culture. Some deal with its sources; some with its interpretation, and some with its historical influence.

In his introduction, R. B. Harris defines Neoplatonism, indicates its main documents, and provides a brief introduction to the major Neoplatonists. The remaining papers are divided into three parts:

In Part I, *The Sources of Neoplatonism*, J. N. Findlay's paper concentrates on the close doctrinal affinities between Plato and Plotinus and offers a strong defense of the thesis that Plotinus' philosophical position is an extension and completion of Plato's metaphysics. H. J. Blumenthal's paper then draws attention to certain major Aristotelian ideas in the construction of Plotinus' psychology in order to explore the paradoxical aspect whereby his conception of the soul is akin to Plato's, but his view of its function is closer to Aristotle's despite the criticism Plotinus advanced against his definition. Michael Dunn then discusses the two reading orders of the Platonic dialogues drawn up by Thrasyllus and the Neoplatonist Iamblichus and shows that the canon of Iamblichus was based on an arbitrary distinction between "physical" and "theological," forcing thus an order that suited "the dogmatic and theological Plato of Neoplatonism."

Part II, *The Interpretation of Neoplatonism*, opens with J. P. Anton's paper in which he assesses Plotinus' understanding of the value and relevance of Aristotle's categorical theory for the comprehension of the sensible world to ascertain whether Plotinus gave a viable analysis of the theory in its original setting, and concludes with the observation that Plotinus' radically different ontology of the sensible object led him to

re-cast Aristotle's categories before criticizing them. J. H. Fielder next undertakes an analysis of the problem of *chorismos* in Plotinus in the special context of how the sensible reality is brought about as an image emanating from a higher level, and after narrowing his inquiry to a single pattern of Plotinus' views on this issue, he exhibits the implications they have for *chorismos* as a conception of imaging. R. T. Wallis' basic theme in his paper is the nature of *experience* on which Plotinus' account of the intelligible world rests, and he pursues it by seeking precedents in classical sources and tracing parallel analogues in modern thinkers. He then takes the position that Plotinus' Three Hypostases are from one point of view elevations of psychological experience.

Continuing in the interpretation of Neoplatonism J. Whittaker shows that the ancestry of the Neoplatonic doctrine of the infinity, as stated by Plotinus, is still far from clarified, but that one may, with the aid of philological tools, acquire a better understanding not only of the historical background of the doctrine but also of the doctrine itself. J. P. Atherton explores the difficulties which the Christian defenders of the trinitarian *arche* sought to overcome through their criticisms of the Neoplatonic One, and concludes with an analysis of the relation this issue bears to the identity of the absolute in Schelling and Hegel. A. H. Armstrong opens his paper with an attempt to elucidate the expression "apprehension of divinity in self and cosmos" in order to show how it obtains in the case of Plotinus' philosophy. He then defends the view that the mode of apprehending divinity is actually one, and that when properly understood, the Neoplatonic way of thinking is not without significance and meaning.

In the next paper P. S. Mamo, in opposition to interpreters who find Plotinus' mysticism to be of the theistic type, defends a monistic interpretation which in its proper philosophical context offers a fuller understanding and appreciation of Plotinus' mystical thought. J. M. Rist, taking his cue from certain basic difficulties that confront recent discussions on the concept of moral obligation, then proceeds to explain Plotinus' views and points out that although he has no formal discussion of moral obligation, it can be shown that the issue is carefully

examined in the light of the broader concept of the good life and the theory of virtue as a state of the soul. Continuing, Evangelos Moutsopoulos shows in his paper how enriched the Plotinian theory of the imaginary becomes when interpretation of the pertinent texts makes its starting point not from imagination as a noetic function but from the image, considered as a first datum, irreducible to a product of the imaginative activity and as that which fertilizes the latter. He then takes a view that places the emphasis on the dynamism of the image but without compromising the dynamism of consciousness. Finally, in this section, John Dillon explores the problem of the rules of Neoplatonic allegory through an examination of the possible differences between the two basic and related terms *eikon* and *symbolon*, and shows through a fair sampling of the relevant sources what applications and problems attended the Neoplatonic allegorical exegesis.

Part III, *The Influence of Neoplatonism*, opens with M. T. Clark's paper in which she takes issue with the thesis that Victorinus' views derived directly from Plotinus and adduces evidence to indicate that the differences between their respective metaphysics are traceable in Victorinus' acceptance of the consubstantiality of the Christian Trinity and that Victorinus depends more upon Porphyry than Plotinus. She concludes that Victorinus' own metaphysics was a new departure and influenced medieval metaphysics. M. G. Vater next shows how in the background of Schelling's own eclectic and original thinking there lurks an affinity and preoccupation with Neoplatonic themes. He suggests that evidence for this is found in a number of his writings and is especially reflected in the dialogue *Bruno* written in the year 1802. In the following essay, D. F. T. Rodier shows how the study of Neoplatonism can help elucidate important problems in process philosophy. After focusing on Whitehead's accounts of creativity and non-statistical judgments of probability, he proposes that these areas of philosophic concern have their counterparts in Plotinus' account of matter and *sympatheia* to such an extent that they may be regarded as reinterpretations of a Neoplatonic theme in terms of process metaphysics. Next, J. N. Deck juxtaposes the thought of Plotinus and Sartre in connection with the ontological investiga-

tion of "being-other-than," and after disclaiming traceable influences he arrives at the conclusion that there are striking similarities between the two thinkers, especially with reference to Plotinus' *Nous* and Sartre's *For-Itself*. Finally, K. W. Harrington examines the movement of the New Humanists of the 1920's and 1930's and Paul Elmer More in particular, and shows that although More was critical of some aspects of the metaphysics and mysticism of Plotinus his Christianizing Platonism led him to conflate the ethics of Plato and Plotinus, despite their differences, and thus erred in attributing to Plato certain ethical and psychological doctrines which are in fact more Neoplatonic than he was able to realize.

## THE SIGNIFICANCE OF NEOPLATONISM

# A Brief Description of Neoplatonism

R. Baine Harris

*Old Dominion University*

There are essentially three ways in which Neoplatonism may be considered to be significant. It may be seen as the last flowering of Hellenistic philosophy—as the last major attempt to bring into one complete system the same themes debated by the philosophers for the eight centuries preceeding it, an effort that involved not only the attempt to resolve the conflict between Plato and Aristotle, but also between the philosophic and religious elements in Graeco-Roman culture. It may also be seen as one of the basic intellectual forces, sometimes open, sometimes hidden, in the evolution of philosophy and theology in the Western world, a force that usually occurred in combination with some other interest. In addition, it may still be seen in its own worth as a general philosophy with some relevance to some of the issues in contemporary philosophy and in modern life.

In this introduction, which is intended mainly for the non-Neoplatonic expert, I will present a general overview of the school of thought by indicating the meaning of the term, identifying the major Neoplatonists, and describing its primary documents. I will not treat the origin of the movement or its impact upon other movements and thinkers, except in a most cursory way, even though these form a vital part of its actual significance.<sup>1</sup>

## I. *What is Neoplatonism?*

Neoplatonism was established as a school of thought by the Egyptian Plotinus (205-270) and his teacher Ammonius Saccas (185-250). Plotinus was the student of

Ammonius in Alexandria for eleven years until he joined the expeditionary force of Emperor Gordianus III in his march against Persia in the year 244. When Gordianus was slain the same year, Plotinus fled to Antioch and then went on to Rome where he set up a school and taught for the next twenty-six years.

The chief document of Neoplatonism is the *Enneads* of Plotinus, a series of fifty-four essays arranged into six divisions of nine each, each division being called an "Ennead." The *Enneads* were composed between the years 254 and 267 and were later arranged according to subjects by Porphyry (c. 232-304), Plotinus' most famous student, who also wrote a biography of his master. Although extremely profound and provocative, the *Enneads* probably deserves to be called the world's worst written book since Plotinus seems to presume that the reader already has a complete knowledge of his system when he discusses any topic. The First Ennead presents his moral philosophy; the Second his physics; the Third his cosmology; the Fourth his psychology; the Fifth his philosophy of mind; and the Sixth his doctrine of reality. The direct influence of the book upon the history of philosophy has been minimal, since it was not widely circulated, but its indirect influence through other widely circulated Neoplatonic works inspired by it has been tremendous. Since it was written in Greek, it was not directly available to the Latin West until Ficino made a Latin translation of it in 1492.

Plotinus and Ammonius did not know that they were Neoplatonists. The term "Neoplatonism" has been used only since the mid-nineteenth century when it was invented by German scholars to distinguish the thought of Plotinus and his successors from the more complete form of Platonism that emerges from all of Plato's writings. Ammonius and Plotinus thought of themselves primarily as reformers and not innovators of Platonism; but as a matter of fact they were both. They sought to reestablish the thought of Plato in its original purity, but as reformers six centuries removed from that to which they would return, they did not succeed in freeing themselves from a certain bias in their conception of the fundamentals of Platonism. More than they realized, they were themselves

products of the general tendency toward eclecticism in Second Century thought and they may not be regarded as *pure* Platonists.

Taken as a whole, the *Enneads* affirm the same themes common to the Platonic tradition, namely, (1) belief in the immateriality of reality, (2) the conviction that the visible and sensible refer to a still higher level of being than the level on which they occur, (3) preference for intuition over empirical forms of knowing, (4) the affirmation of the immortality of the soul, (5) belief that the universe in its most real state is good, and can be known as good, and (6) the tendency to identify the beautiful, the good, and the true as one and the same.

Plotinus' main thrust in the *Enneads* is a defense of Plato against Aristotle's criticism, but in defending his ancient idol he makes major concessions to Aristotle. Although he mentions Aristotle by name only four times, he shows great familiarity with his writings and borrows a number of his fundamental notions from him, notably those of power (*δύναμις*) and energy (*ἐνέργεια*). The Platonism of the *Enneads* is actually a hybrid resulting from the blending of Platonism and Aristotelianism, and at times it is difficult to determine which one is dominant. Dean Inge suggested that it could be said that Plotinus knew and understood Aristotle better than he did Plato,<sup>2</sup> and Ernst Hoffman thought that Neoplatonism would better be called "Neo-Aristotelianism," especially in view of the fact that the majority of the Neoplatonic systems after Plotinus have been nearer to the dialectic of Aristotle than to Plato's dialectic.<sup>3</sup> Most of Plotinus' immediate successors believed that he had achieved the unification of Platonism and Aristotelianism.

Plotinus was not satisfied with either Plato's or Aristotle's final conception of the Ultimate and he was bothered by Plato's dichotomies. He accepted Aristotle's criticism of Plato as essentially valid and he accepted Aristotle's dialectical method as superior to that of Plato and basically followed it even though he did specifically reject Aristotle's categories (V.I.1-30) and substituted those of his own, namely, Thought (*νοῦς*) and Thing (*ὄν*); Difference (*ἐτερότης*) and Sameness

(ταυτότης); and Permanence (στάσις) and Change (κίνησις) (V.2.1–V.3.27). (See also V.1.4; VI.2.15,19; and VI.2.8) He rejected Aristotle's logic, and specifically his formal logic (I.3.4) and he developed a Platonic-type logic of his own to devise an Aristotelian-type dialectic of his own. He uses logic the way Aristotle does to set up a dialectical system, but his logic is more akin in type to Plato's logic than it is to Aristotle's.<sup>4</sup> Practically all the Neoplatonists who followed him, however, followed the example of his disciple Porphyry in ignoring his logic and substituting the logic of Aristotle for it, so that for all practical purposes Neoplatonic logic is not Plotinian logic.

Plotinus remained a Platonist in his conception of what the nature of the philosophic enterprise is, but he is a post-Aristotelian Platonist. Basically, what he rejected in Aristotle was his world view, his conception of the range of philosophy, and the adequacy of his logic as a basis for dialectics. He objected to Aristotle with the same high level of precision and the same degree of understanding that Aristotle shows for Plato. Whereas Aristotle did not so much challenge the meaning of the root concepts of Plato as he did the basis upon which he established them, Plotinus does not really challenge the basis of Aristotle's thought as much as he questions the adequacy of his system. He conquers him by absorbing him and retaining him almost intact as the middle section of his own highly refurbished and enlarged Platonic system.

Plotinus' own contribution is, however, much greater than that of a harmonizer of Plato and Aristotle. By his identity of the Pythagorean One with the transcendent Good of Plato, but minus Plato's *ὄν*, his own Ultimate is greater than the Ultimates of either Plato or Aristotle. The Plotinian One should not be conceived of as "sheer unity" in the Parmenidean sense and neither as "barrenness of being," or even "absolute nothingness." *τὸ ἓν* should rather be understood in the Pythagorean sense of **the base unity of all multiplicities**. It is nothing because it is everything. It is no-one-thing, non-existent, and non-being, because any sense of thingness, or existence, or its being would be a prostitution of its genuine nature. It is even much more than "the ground of being." It is the point where all themes

merge, the one "principle" that contains the fundamentals of all principles, the one line into which all lines merge. It is responsible for being in the only level that being can occur, namely in the level in which the One can be differentiated in Aristotle's *νοῦς*. At this second and lower ontic, epistemic, and value level, being is determinate, very much as Aristotle suggests, and it is progressively less determinate and "less principled" in all of the myriads of inner sequential levels within the range of *νοῦς* and on down into the many levels within the level of *ψυχή*, which is in reality *νοῦς* in motion. The One, of course, is not material, and neither is Mind or Soul, since the purely material cannot exist.

That which is taken to be material is in actuality Soul. It is an extension of Soul down below the normal level of Soul, or better, it is Soul in its lowest possible level of being. Just as all of the level of Soul is an extension of Mind down below its normal level, or Mind in its lowest possible level, so Mind is the One in an extension down below its normal level, or the One in its lowest possible level. Thus Plotinus's Ultimate is transcendent in its level as the One from all determinate being, but it is immanent in it as *νοῦς*, namely, as *νοῦς* forms the basis for the various orders and levels of the events of souls. In this way Plotinus sought to establish the spiritual nature of reality, showing the immaterial ground of both spiritual and material things in contrast to the Stoics who sought to establish the material base of spiritual reality.

In his doctrine of emanation, or the procession of all things from the One, Plotinus appears to have taken that which Plato presented as myth and turned it into straight doctrine, namely Plato's analogy of the *ἀγαθόν* with the radiation from the Sun in the *Republic* (509). The Stoics had already used the idea of emanation or irradiation, and he quite likely borrowed the notion from them, but they used it to illustrate a *material* diffusion and depletion, the one that most naturally comes to the Twentieth Century mind when radiation is mentioned. It is important to note that Plotinus is *not* describing a material structure. Instead, he is trying to convey the idea of the permanent structure of *spiritual* essences. The procession is not a procession in time. He is describing the logical, and not the chronological order of being and is being very Greek in doing

so, since he is assuming that the permanent and fixed is more genuine, i.e., more real, than that which is in motion. He is suggesting that that which is in motion, namely, souls, has its reality in its fixed elements, namely, its structure as *νοῦς*. Since he regarded light as an immaterial substance (II. 1.7; IV.5.6-7; I.6.3), his use of it as an illustration of radiation should not be taken to mean radiation in the modern sense.

Plotinus is sometimes labeled a mystic, and this label is correct with certain qualifications. He might be described as a rational mystic or perhaps a "metaphysical mystic," since he believed in the necessity of logic and metaphysical understanding as a means to mystical experience. To him it would be scandalous to think of enlightenment without the prior practice of morality and philosophy. As Erwin Edman puts it, "For Plotinus mysticism is not the evasion but the climax of thought,"<sup>5</sup> Salvation, as Plotinus sees it, is essentially a technique involving three processes: (1) catharsis, or the purification of the soul through morality, (2) dialectics, or the practice of the discipline of philosophy; and (3) illumination, or enlightenment (*νόησις*) -- a state of ecstasy wherein the soul finally comes into direct communion with that part of the One that is already within it. The way of salvation is a journey from soul to mind to the One during which the soul progressively sees itself as an element of the Ultimate. Salvation is not from above, it is from within; and it is not free -- it is very expensive and rarely achieved. By most men it is only relatively achieved, depending upon which level they succeed in attaining.

Plotinus actually placed a higher premium on philosophical activity than did Plato, since he made the practice of dialectics one of the necessary steps of salvation. Salvation begins with self-purification and the practice of ordinary moral life, namely, meeting one's civic responsibilities and the practicing of the Platonic virtues of wisdom, courage, temperance, and justice (I.2.2). The first stage is self-purification, namely, the purification of one's motives and actions. But morality is more than not doing evil, it is doing good in a positive way -- it is an expression of the purity of the soul (I.2.4). This leads to the third level, the freeing of the soul from all bodily desires. Only then may the practice of dialectics begin. Essentially it involves

the soul's turning away from itself as an object of concern and fixing its attention upon the *νοῦς*. Dialectics for Plotinus is a science, a form of philosophical analysis in which logic is used as a tool for the analysis of reality, i.e., for the determination of the evidences of *νοῦς* in everything that there is. It is by means of this form of analysis that the soul eventually turns introspectively into itself and sees itself as essentially *νοῦς* (VI.7.34; VI.9.11). In this stage, which might be called the highest level of dialectics, the soul sees itself as mind -- it has a *soul to Mind* identity, but this is not yet illumination. This occurs only when the soul passes beyond dialectics into a direct grasping of reality that transcends logic and analysis -- when the soul passes beyond seeing itself as mind and sees itself as the One in a *soul to One* identity. In this state the soul ceases to know itself as soul or mind and knows itself only as the One (VI.9.9-10).

In some respects Plotinus' way of salvation is reminiscent of Plato's theory of knowledge, since Plato places intuition higher than discursive reason. Plotinus's theory of knowledge, however, goes considerably farther than the limits of Plato's epistemology. Although Plato believes that all universal concepts have objective reference, he did not state very clearly the exact relation between the particular and the universal, a weakness for which he was severely criticized by Aristotle, and a weakness which both Aristotle and Plotinus seek to overcome in very different ways. In Plotinus, as we have just seen, true knowledge passes on beyond general knowledge to a direct knowing of the Ultimate. Although this view is not inconsistent with Plato's epistemology, it is a rather radical development of it in view of the more cautious limits that Plato imposed upon knowing.

Plotinus' view is even more radical than Plato's, since he does not set the knower off from his objects, as do Plato and Aristotle, but rather makes the intelligible universe within the subject as the object for knowledge. Like Aristotle, he makes knowing a form of abstraction, but it is more than the abstraction of common forms out of common sensibles. It is an identity of like kinds when the non-essential elements that confuse the issue have been taken away. It is like perceiving like.

Seen in its boldest profile, then, Neoplatonism is an effort to reconcile Aristotelianism with Platonism through an appeal to a still higher unifying principle than is found in either of the two, namely, an Ultimate First Principle that is *both* transcendent and immanent in all nature, indefinable *and* knowable, self-sufficient *and* creative throughout the universe without an act of will. It is an effort to subsume the major elements of Aristotle's system within a revised but fundamentally *Platonic* framework of thought; an effort that Aristotle himself would have vigorously protested, as most pure Aristotelians down through the centuries have done.<sup>6</sup>

## II. The Early Neoplatonists

The first authentic Neoplatonist was probably *Ammonius Saccas* (175-250 A.D.), the porter who taught in Alexandria during the last part of the first quarter of the third century. Since he left no writings, his claim to fame rests upon the success of his famous pupils: Plotinus, the two Origenes, the philologist Longinus, and Herennius. Although some of them refer to his thought occasionally, it is impossible to determine which of their views were inspired by him. In any case Plotinus (205-270), just discussed, was the first notable Neoplatonist.

*Amelius Gentilianus* (c. 275), a senior professor in the school that Plotinus founded in Rome, also began his studies in Alexandria. He was responsible for the conversion of Porphyry to Neoplatonism, but he made no written contribution to the school of thought. His principle literary activity was his effort to show the differences in the thought of Plotinus and Numenius of Apamea, whom he also greatly admired. He did alter Plotinus' views slightly by distinguishing three hypotheses within the *νοῦς* and by holding that all souls find their unity within the World-Soul instead of in the One. In contrast to Plotinus he practiced public religion, praying to the gods and observing the feasts and sacrifices, a practice for which he received no censure from his colleague.

*Porphyry* (232-c.304). Like Plato, Plotinus also suffered the fate of having his philosophy altered by his disciples. However, if it had not been for Porphyry, who was able to

express his rather abstruse ideas in a more palatable form, his philosophy may not have survived at all. As an expositor of the thought of Plotinus, his writings were very widely distributed both in his own time and in later centuries. He wrote one book in defense of vegetarianism, one extolling "abstemiousness," and another entitled *Against the Christians*. The latter had fifteen chapters in which he opposed the divinity of Christ, set forth contradictions in the Christian scriptures, and denied the divine inspiration of the Old Testament, a line of thought that was continued in the Syrian, Pergamumian, and Athenian schools of Neoplatonism. The book, however, was condemned by Emperor Theodosius in 435 and all existing copies were destroyed. He also wrote a book on the *Categories* of Aristotle that was translated into Latin by Boethius and became one of the most widely read philosophical texts of the Middle Ages. In his writings he gave a certain slant in the interpretation of Neoplatonism that was continued by his followers on down until the Ninth Century. He replaced the logic and categories of Plotinus with those of Aristotle and made the aim of philosophy the salvation of the soul. Claiming that evil came from the nature of the soul and not the body, he sought to purify the soul through various forms of asceticism as well as through knowledge of God. He also had a much higher interest than Plotinus in *daemons*, which Plotinus had defined as spirit-beings without bodies (III. 5.6), not born of souls nor produced by the World-Soul and with bodies of fire (II.1.6) that do not participate in bodily matter (III.5.6). Whereas Plotinus put all of nature within the action of souls and hence related it to *νοῦς* and the Ultimate and thus free from the actions of *daemons*, Porphyry and some of his followers allowed nature to be affected by the capricious actions of *daemons*. He also began, but did not develop, the tendency to express the Plotinian system in a series of triads within triads and his system is generally more monistic than that of Plotinus. He also put more emphasis on practical ethical issues.

*Iamblichus*, (c.250-326) a native of Chalcis in Coele-Syria, studied with Porphyry for some time and then returned to his native country to found the Syrian School of Neoplatonism, which especially emphasized theurgy as a means of salvation.

Although Porphyry retained an interest in theurgic practices after his conversion to Plotinism, he limited it to the very lowest levels of the journey for salvation, while Iamblichus and his followers saw it as a higher way. Iamblichus posited a One above the One of Plotinus, namely, an absolutely ineffable One entirely without attributes. Below this One is the Plotinian One which in turn produces the intelligible world, which has three parts, and which in turn produces the intellectual world, which also has three parts, the latter being the Demiurge, which has seven divisions. Below the level of the intellectual world is the world of souls, which are also divided into a series of triads. Salvation is not *ἐκστασις*, but union with the gods through rites and ceremonies. A student of Iamblichus, Aedesius, founded a school of Neoplatonism at Pergamum. One of its leaders, Maximus of Smyrna was a Neoplatonic priest to the Emperor Julian the Apostate (331-363), a nephew of Constantine the Great who succeeded Constantius as emperor in 361. Another of Iamblichus' students, Plutarch of Athens (c.350-433) was the first Neoplatonist to become the head of the Platonic Academy in Athens in about the year 400. He was succeeded by Syrianus in about 432 and Proclus in 438, both of whom were Neoplatonists.

Proclus (c. 409-c. 487), the next major Neoplatonist after Porphyry, was a Greek native of Constantinople who had studied with Olympiodorus in Alexandria before coming to Athens at the age of nineteen to study with Plutarch and Syrianus. Being both scholarly and "scholastic," he developed the Iamblichean brand of Neoplatonism to its logical extremes, projecting triads within triads seemingly at every opportunity. A man of great energy and enthusiasm, he lectured five times a day, wrote a great deal, and still found time to give his evenings to his students and to take an active part in municipal government. In addition, he was quite zealous in his religious activities, worshipping the sun three times a day, observing all the Egyptian holy days, and spending part of the night in prayer, praise, and the making of sacrifices. Dean Inge says that his religion was an amalgamation of various cults and might be compared to Comte's "Religion of Humanity."<sup>7</sup>

Metaphysically, Proclus reduced Plotinus' rather loose and organic system to an absolutely complete and rigid one by

developing many more triads within triads for Plotinus' three emanations. It was his thesis that all things emanate by triads, and also emanate horizontally by triads as well as vertically. He believed that all things evolve by triads and also need to return, by triads, to the Ultimate. Whereas for Plotinus the procession of the lower stages out of the higher was continuous and equal in degree of emanation, Proclus specified that the lower remains in the higher in its first aspect, leaves it in its second aspect, and returns to it in a third aspect.

Like Plotinus, he taught that man's ultimate goal is union with the Ultimate, but added that theurgy can be an aid higher than the practice of dialectics. He was highly influenced by Plato's *Timaeus*, and once stated that if it were in his power to do so he would withdraw all books from human knowledge except the *Timaeus* and the *Chaldaean Oracles*.

In two of his works, *Elements of Theology* and *Plato's Theology*, he provided elaborate explanations of Neoplatonism. Both were fairly well circulated and had no small influence upon Byzantine, Arabic, and early medieval Latin Christian thought. Indirectly he was the source of many elements of medieval scholastic Christian thought, since the very widely circulated Christian documents, *Divine Names* and *Mystical Theology*, purportedly written by Dionysius the Areopagite, a disciple of St. Paul, but actually written by some unknown monk in the late fifth century, were in actuality adaptations of Proclus' thought.

Proclus' successor was Marinus, a Palestinian Jew. It is possible that he was the source of the Neoplatonism that got into the medieval Jewish tradition, if not of the mysticism of "the Book of Creation," the *Sefer Yezirah*. Athenian Neoplatonism, i.e., the Academy, lasted for about forty years after Proclus, until it was shut down by decree of Justinian I in 529. The last *διδάσκαλος* was Damascius (b. 458) whose main innovation was to make not only the Ultimate but all products of it as ineffable, thus carrying Iamblichean Neoplatonism on out to the extreme of severing the connection God and Nature that Plotinus was so concerned to establish.

Neoplatonism continued to flourish in Rome and Alexandria during the time of the late Academy in Athens, but no

notable ideological changes occurred in it in either location. It continued in Rome until the latter part of the sixth century. Among its products was the Neoplatonic Christian Marius Victorinus (c. 350), whose Latin translations of Neoplatonic literature were read by Augustine and Boethius (c. 470-525). Boethius' *The Consolation of Philosophy* and his translations and commentaries on Aristotle were widely read and both influenced medieval theology.

The Alexandrian School of Neoplatonism began in the middle of the fourth century and appears to have maintained strong connections with Athenian Neoplatonism at this time, including exchanging professors. Generally, the Alexandrian Neoplatonic professors remained closer to the thought of Plato and the Middle Platonists and did not enter into metaphysical speculations, theology, and theurgy, as did the Athenians, and they displayed a more conciliatory attitude toward Christianity. One of the heads of the school was a female mathematician-philosopher named Hypatia, who in 415 was taken from her carriage by a mob of fanatical Christians and lynched inside a Christian church. The school was shut down with the capture of the city by the Arabs in 642. The last known Alexandrian Neoplatonist was Stephanus (c.600), who later as a Christian went to Constantinople to be the director of the Imperial Academy of Byzantium and was partly responsible for the transmission of Neoplatonism into Byzantine culture.

### III. Later Variations of Neoplatonism

It could probably be said that there has not been a single pure Neoplatonist since the Fifth Century, since most of those who might be labeled as Neoplatonists have actually held Neoplatonic views in combination with other commitments. Even Eriugena, who would surely be the nearest candidate, held tenaciously to certain points of Christian dogma that would prevent him from being a complete Neoplatonist. In the case of all the Neoplatonists after 500 A. D., it can be debated whether or not they are *actually* Neoplatonists, depending upon which criterion is finally appealed to, whether to the origin of their thought, to the actual percentage of Neoplatonic notions found in their writings, or some dogmatic definition of a Neoplatonist.

#### A. Byzantine Neoplatonism

When Justinian ordered the closing of the Athenian School of Neoplatonism in 529, seven of its professors, including Damascius and Simplicius went into Persia to the court of Chosroes I to continue their profession, but by 533 they had returned to Byzantium where they continued their studies. Although little more has been said about them, there is evidence that Neoplatonism did not die out in Byzantine culture. Apart from the actual influence of these seven and their disciples, we must consider the impact of both the Arabic and Christian Neoplatonists upon Byzantine civilization. Greek Christianity has always been more Neoplatonic than Latin Christianity, likely due to the initial impact made upon it by *Origen of Alexandria* (185-254), the early Greek church father who, like Plotinus, was also a student of Ammonius Saccas. Although he could not officially be labeled a Neoplatonist, he had quite similar views which also got into the thought of other important Greek church fathers such as the Cappadocians, Basil, and the two Gregories—all of whom were taken seriously in Byzantine Christianity.

A certain revival of a purer form of Neoplatonism occurred with the advent of *Michael Psellus* (1018-79), who with the help of Constantine IX re-established the teaching of Neoplatonic philosophy in the University of Byzantium. Psellus chose to go back to Proclus for his main source of inspiration and the Proclean brand of Neoplatonism was carried on by his disciples who produced numerous commentaries on the thought of Aristotle. Psellus was also an intellectual influence on the thought of *George Gemistus Pletho* (c.1360-c.1450) who established a school of Neoplatonism at Mistra in the Peloponnese and was also instrumental in the establishment of the Neoplatonic Academy in Florence.

#### B. Islamic Neoplatonism

One of the most important sources of Neoplatonism for early Islamic scholars was an anonymous Neoplatonic work called *Theologia Aristotelis*, which was in fact a paraphrase of the Fourth, Fifth, and Sixth *Enneads* of Plotinus. *al-Kindi* (c.866 d.) one of the first Muslim philosophical theologians,

wrote a commentary on it. *al-Farabi* (c.870-950) also revived the study of Neoplatonism through his *Opinions of the Inhabitants of the Virtuous City*, in which he presented his own essentially Neoplatonic philosophical system. He was especially interested in the thought of Porphyry, having written a commentary of his *Isagoge* and essentially having followed his interpretation of Aristotle. In his *Reconciliation of Plato and Aristotle* he exhibits the same aim of Plotinus in his *Enneads*, an aim shared by Porphyry, Syrianus, Simplicius, and Damascius as well. Generally speaking, it can be said that most of the Arabian Neoplatonists were in the Porphyrian tradition.

A later Neoplatonic Muslim theologian *Avicenna* (980-1037) was influenced by *al-Farabi's* views, but appears to lean more toward Plotinus than Porphyry. His interest in Neoplatonism was mainly in its use as a device in understanding Islam. The most ideal intellectual outlook, according to him, would be the interpretation of Islam in Plotinian concepts. His position was strongly attacked by *al-Ghazzali*. The views of *al-Farabi* were also echoed in the writings of *Averroes*, (1126-1198) a Spanish Arabic philosopher who was very much interested in Aristotle and in Porphyrian Neoplatonism.

#### C. Jewish Neoplatonism

Jewish Neoplatonism appears to have originated primarily with *Isaac ben Solomon Israeli* (850-950), a court physician at Kairwan who had read the writings of *al-Kindi* and also the *Theology of Aristotle*. His pupil Dunash ibn Tamim wrote a Neoplatonic work entitled the Commentary on *Sefer Yesirah* and his views are also seen in the *Olam Katan* of *Joseph ibn Saddik* (d.1149), a later Jewish Neoplatonist.

The Spanish Jewish philosopher *Solomon ibn Gabirol* (1020-1070), also known as *Avencebron*, indicated a heavy Neoplatonic influence on his cosmology as expressed in his chief work *The Fountain of Life* (*Fons vitae*). His works were well known by the Scholastics. The *Sefer Hobot ha-Lebabot* by *Bahya ibn Paquda*, written in the eleventh century also contains elements of Neoplatonic mysticism as does the *Hegyon ha-Nefesh* (*Meditation of the Soul*) by *Abraham bar Hiyya* of Barcelona (c.1130). A pantheistic variety of Jewish Neopla-

tonism was developed by *Abraham ibn Ezra* (c.1092-1167). Generally speaking, it may be said that the whole Jewish Neoplatonic tradition had a major share in the development of the *Kabbalah*.

#### D. Medieval Christian Neoplatonism

Two men, *Augustine* (354-430) and *Boethius* (470-525) were mainly responsible for the transference of Neoplatonic ideas from the early Neoplatonists into Latin Christianity. Although neither made any significant contribution to Neoplatonic thought itself, their influence upon the thought of the Christian world in the ten centuries following them was phenomenal.

Augustine's Neoplatonism came from his reading of Victorinus' translation of certain Neoplatonic writings apparently just before and just after his conversion to Christianity in 386. Although he appears to have known quite well the difference between the Gospels and the *Enneads*, the fact remains that his writings are permeated with Neoplatonic notions. Even though he differs with the Neoplatonists in his view of the nature of God and his relation to the world, he essentially agrees with them in his ontology, in his general theory of value, and in his description of the nature of the life of man on earth. Even though their modes of salvation differ, their meaning of salvation is fairly similar—union with the One is very similar to the beatific vision of God. It is a somewhat academic issue whether Augustine can correctly be labeled a Neoplatonist, but due to the very large number of people who have read his writings down through the centuries it is likely that he has introduced more people to some elements of Neoplatonism than has anyone else in history.

Boethius' Neoplatonism came from his reading of the writings of some of the later Alexandrian Neoplatonists, but he was also familiar with Porphyry's *Isagoge*. He wrote a commentary on it. His influence was particularly strong in the court and cloister schools in the period from the sixth through the twelfth centuries through his translation and interpretations of Porphyry's *Isagoge*, a text on elementary logic, his translations and commentaries of the logical treatises of Aristotle, and through

his own *The Consolation of Philosophy*. Written in prison while awaiting his execution for treason by the Gothic king Theodoric, the *Consolation* may be described as an exercise in Christian Neoplatonic religious philosophy, with major emphasis being upon the latter element. Although he conceived of himself as a follower of Cicero, the work actually represents the Neoplatonism of the late Alexandrian School (Origen, Hierocles, Syrianus, Hermias). It was widely read throughout the Middle Ages and its influence was most extensive. Alfred the Great translated it into Anglo-Saxon. Chaucer and others translated it into English, and it also appeared in German, French, Italian, Spanish and Greek during the Renaissance. Boethius himself has been variously described as the last Roman philosopher and the first Scholastic.

The next important Christian Neoplatonic philosopher in the West was John the Scot, sometimes known by his Latin name *Eriugena* (c.820-870). An Irish Christian monk, he was brought to the court school of John the Bald in Paris about 847 because he knew Greek and was needed to translate a manuscript of pseudo-Dionysius, *The Divine Names*, kept in the nearby monastery of St. Denis. *The Divine Names* dates back to the late fifth century and is a somewhat Christian adaptation of the thought of Proclus. During his long stay in Paris, until his death in 870, he translated three other Neoplatonic works in the Proclean tradition and wrote at least five books, the most famous being *On the Division of Nature*, a work of a half million words in which he presents his own highly speculative Neoplatonic system. Although this book is ostensibly about the nature of nature, he uses the term in the broadest possible sense to mean everything that there is including God. God, the highest reality, he defines as "the nature which creates and is not created." Man fits into the second level of nature, namely, "nature which creates and is created." The chemical elements would illustrate the third level, namely, "nature which does not create and is created."

Eriugena saw clearly that it is necessary to talk about nature in order to talk seriously about God and that it is necessary to talk about God in order to say anything metaphys-

ically significant about nature, a position not well appreciated by his contemporaries. He was generally regarded as a pantheist, which, indeed, he was not. His works exercised no major influence upon the thought of the later Middle Ages, partly because his writings were condemned as heretical by Pope Honorius III in 1225 and again in 1585 by Pope Gregory XIII, and partly because of the Church's general rejection of Neoplatonic philosophy, and to a lesser degree of all Greek thinkers. They fared somewhat better in later centuries, however, since he is known to have had some influence on the thought of Berengar of Tours, Avicbron, Gilbert de la Porre, Simon of Tournai, the Albigenses and Catharists, Amalric, David of Dinant, Nicholas of Cusa, Giordano Bruno, Eckhart, Tauler, Ruysbroeck, the Kabbalists, and even Hegel. Albert the Great, the teacher of St. Thomas, was quite familiar with the thought of David of Dinant.<sup>8</sup>

Most of the major Christian writers of the late Middle Ages appear to have some knowledge of Neoplatonism. Even St. Thomas Aquinas (1225-1274) has a certain Neoplatonic element in his thought. He wrote a commentary on *The Divine Names* and he was influenced by the Neoplatonic elements in St. Augustine and Boethius. Dean Inge even asserts: "to me, at least, it is clear that St. Thomas is nearer to Plotinus than to the real Aristotle." Dante's *Divine Comedy* is highly Neoplatonic in parts, and *Meister Eckhart* (1260-1327) and his pupils *Tauler* (1300-1361) and *Suso* (c. 1295-1366) show evidence of the thought of Dionysius and Eriugena in their writings. Cardinal *Nicholas of Cusa* (1401-1464) arranged for a translation of Proclus' *Platonic Theology* and his own thought may be seen as a bridge between Medieval and Renaissance Neoplatonism.

#### E. Renaissance Neoplatonism

Renaissance Neoplatonism formally began with the founding of the Florentine Academy in 1462 by Cosimo di' Medici, an action inspired by George Gemistus Pletho in 1438 when he was a delegate to the Council of Florence for the reunion of Eastern and Western Christianity. The affairs of the academy mainly revolved around the work of *Marsilio Ficino* (1433-1499) and his pupil *Giovanni Pico della Mirandola*

(1463-1494). Ficino produced an edition of the works of Plato, with commentary, and the first Latin translation (in 1492) of the *Enneads*. His own major work, the *Platonic Theology on the Immortality of the Soul* (1474) and his commentary on the *Symposium* (1469) were also widely read, especially in later centuries. Pico's *Oration on the Dignity of Man* was a basic document of Renaissance humanism. Although the academy dissolved at the death of Ficino, its tradition was carried on at the universities of Florence and Pisa until the seventeenth century.

#### F. The Cambridge Platonists

Some elements of Florentine Neoplatonism were imported into England in the late fourteen nineties by *John Colet* (1466-1519), who was then Dean of St. Paul's Cathedral. Colet carried on correspondence with Ficino, wrote a commentary on the writings of pseudo-Dionysius, and paved the way for the seventeenth century Neoplatonists known as the Cambridge Platonists, namely, *Benjamin Whichcote* (1609-1683); *John Smith* (1616-1652); *Ralph Cudworth* (1617-1685); *Nathaniel Culverwel* (1618?-1651); *Henry More* (1614-1687); and *Peter Sterry* (d. 1672). The main objective of their writings was to work out a blending of English Protestant Christianity and Neoplatonic thought, or more specifically, Plotinian thought. Their views were continued in the Broad Church tradition in the Church of England, represented by such men as *F. D. Maurice*, (1805-1872), *B. F. Westcott* (1825-1901), and *W. R. Inge*, (1860-1954).

#### G. German Neoplatonism

German Neoplatonism stems mainly from *Meister Eckhart* (1260-1327), already mentioned. A monk of the Dominican order, he turned to the writings of Eriugena and pseudo-Dionysius for inspiration and reinforcement in his own reaction to Aristotelianism, a policy continued by Tauler and Suso, and a century later by Nicholas of Cusa, Bishop of Brixen. Although there were no major German Neoplatonists, there is a strong

undercurrent of Neoplatonic ideas in the whole German Idealistic tradition. It is seen in Leibniz's monadism, in Schelling's *Naturphilosophie*, and in Hegel's doctrine of the Absolute.

#### H. Recent Neoplatonism

Neoplatonism has had considerably less direct influence on contemporary French and British thought than it has on recent German philosophy. In England its main influence has been in the field of literature, with the possible exception of Berkeley's *Siris*, which has strong affinities with Plotinian mysticism. Neoplatonic notions are found in Spencer, in Wordsworth, in Shelly, in William Blake, in Coleridge, and in Yeats. In France, the influence of Plotinus upon Henri Bergson's thought is quite obvious. For two years (1897-98) Bergson lectured at the College de France on the fourth Ennead of Plotinus (Concerning the Soul) and some of his views on memory very likely came from Plotinus' theory of consciousness.

Even though American Philosophy shows little Neoplatonic influence, it would be possible to note an affinity between certain views of Charles S. Peirce and those of Plotinus, as William James once noted. James' own attempt to ground religious meaning on religious experience had already been accomplished by Plotinus. Whitehead, at least in the mind of this writer, gives certain intimations of a knowledge of Neoplatonism and it would be possible to regard the system that he suggests in *Process and Reality*, as a modern example of the *type* of system produced by Plotinus within the level of *νοῦς*.

Interest in Neoplatonism has steadily increased over the past seventy five years. Not only has there been a greater recognition of its role in the formation of Western, and especially European thought, but the writings of the major Neoplatonists, and especially Plotinus, have been seriously read for their own worth. Numerous doctoral dissertations have been written on the divergencies of the views of the various Neoplatonists and also on Plotinus' analyses of psychological and theological concepts.

Although we can expect little modern interest in Plotinus' essentially Ptolemaic scientific views, his teachings on the relation of dialectics, art, science, and religious experience may still be seen to be viable in our scientific age; and they may again serve as a humanizing agent in culture, as they have upon various occasions in the past.

### NOTES

1. An international conference on the sources of Neoplatonism was held near Geneva in August of 1957. Its papers were published in *Les Sources de Plotin* (Tome V, *Entretiens sur L'Antiquité Classique*) (Geneva: Fondation Hardt, 1960). Another congress on Neoplatonism was held in Rome in 1970. Its papers were published as *Atti del Convegno Internazionale sul tema 'Plotino e il Neo-Platonismo'*.

## PART ONE

### The Sources of Neoplatonism

## The Neoplatonism of Plato

J. N. Findlay  
*Boston University*

I shall begin my somewhat controversial paper with a quotation from Plotinus, Ennead V, Tractate I, Paragraph 8. Plotinus says: "And for this reason Plato established a triplicity. All the prime things stand about the King of All, and secondary things are embraced by a Second Principle and third things by a Third Principle. And he says there is a Father of the Cause, meaning by the Cause the Nous or Mind, for the Mind is his Demiurge who manufactures the Soul in that famous cup. By the Father of the Cause, i.e., of the Mind, he means the Good, which is beyond Mind and beyond Being. And often he uses the term 'Idea' to cover Being and Mind. So that what we say represents no novelty, and was said not now, but long ago, though in inexplicit fashion. Our present exposition is merely an exegesis of what was then said, and relies for its proof of antiquity on the writing of Plato himself. Parmenides also took up a like doctrine in his identification of Being and Mind, and in his refusal to locate Being in the sensible world. . . . But the *Parmenides* of Plato achieves greater accuracy in separating from one another the Primal One, which is more preeminently one, a second One which is a One-Many, and third One which is both One and Many. He therefore also agrees with our three natures."

In this passage Plotinus dispersedly quotes and interprets the Second and Sixth Platonic Epistle, the *Timaeus*, the *Republic*, the Dialogues *passim* and the Platonic dialogue *Parmenides*, together with the original poem to which this last distantly harks back. All these, Plotinus says, teach the doctrine of the Three Original Hypostases which are the theme of

Ennead V.1, and which are the foundation of the Plotinian ontology. It will be the argument of this paper that Plotinus is justified in these arguments, and that the basic Neoplatonic doctrines are in fact what can and must be collected from a careful and understanding reading of the main Platonic writings, with some necessary help from Aristotle, who after all heard Plato actually talking in the Academy (though some picture Plato as permanently dumb), and from the statements of the Aristotelian commentators and a few other similar sources. I am not saying that the first Neoplatonists did not carry Plato's doctrine somewhat further at a number of points, and that they did not tinge it with a richer mysticism than is even to be found in Plato. I am also not saying that there are not sides to Plato's thought of which they made practically no sense or use: Plato's interest, e.g., in ingenious and often sophistical argument carried on for its own sake, his deep belief that everything admitted of a mathematical analysis, and his search for Principles of Things which were also Principles of Number, and so on. I am, however, saying that they were right in their interpretation of most of what should be regarded as deeply original and basic in Plato, and that, if many of the Platonic Dialogues do not give us Plato, but Socrates made young and beautiful, so the central Plotinian treatises do not give us Plotinus or Saccas, but rather Plato brought out from hinting incompleteness to expository fullness and coherence, and freed from many of the tiresome stylistic and argumentative reflexes due to a too long impersonation of Socrates.

In my view, then, a very important happening took place in Alexandria at the beginning of the Third Century A.D. when Ammonius Saccas began his exegeses of Plato, basing himself on the important assumption, much more true than false, of a profound *Homodoxy* or agreement in opinion between Plato and Aristotle. His work involved an attempt to see Plato as something more than a brilliant virtuoso of inconclusive, often fallacious, argument—a role only admirable or tolerable in Socrates on account of his existentially revealed conviction as to the impossibility of defining the virtues in any clear-cut manner, or apart from one another, or apart from the critical activity which redefines them unendingly—and as something

more than an ancestor of the Neo-Pythagorean mystagogues who dispense a "way of life" to those doomed to live it under the Roman Empire, and as something more, lastly, than one of those philosophical litterateurs who charm us all the more since there is only an appearance of what is clear and compelling in what they say. It represented an attempt to make serious philosophical sense of Plato, as a thinker desirous of determining what primarily is, and what only is in some secondary or derivative manner, and how the various senses and grades of what is may be accommodated to one another and to the human soul and mind with its profound need to understand and love. Obviously it would be in such Dialogues as the *Phaedo* and the *Phaedrus* and the *Symposium* and the *Republic* and the *Timaeus*, and a suitably interpreted *Parmenides*, and also in the *Platonic Letters*, that the materials for such interpretation would be found, and not at all in such brilliant exercises in self-refutation as the latter part of the *Theaetetus* or some of the earlier Dialogues. And it incorporated strands from the pre-Socratics and from Aristotle and the Stoa because these could be regarded either as leading up to or continuing the serious Platonic effort, which most of the moralizers and argumentative skeptics and mystical Platonizers of the half-millennium between the time of Plato and Plotinus arguably could not. It was not, as some have thought, by borrowings from these transitional people, but by a deep immersion in the writings of Plato and also of Aristotle that Saccas and Plotinus came to create their Neoplatonic philosophy.

I myself am inclined to ascribe the new wave of Platonic *approfondissement* to Saccas rather than Plotinus, basing myself on the fact that it was only when Erennius and Origen, the fellow-pupils of Plotinus, started publishing what they had learnt from Saccas, that Plotinus felt himself freed from any arcane discipline, and began publishing what he must in large measure have derived from Saccas, since he had hesitated to publish it previously. And I also base myself on the fact that I see comparative little development in the treatises of Plotinus. They are the varying expositions of an already established body of doctrine, to which Plotinus may have made some brilliant additions, but whose basic pattern had been previously laid down.

I may say here at the beginning of my paper that no claim for the Neoplatonism of Plato can be sustained if one's conception of what Plato taught and thought is to rest on the assumption that this will be fully explicit in the Dialogues, and that one should not do the least dotting of *i*'s or crossing of *t*'s for which a warrant in the Dialogues is not available. Plato, says Sir David Ross, is nothing if not explicit: to this axiom we may oppose the axiom: "Plato is nothing if not inexplicit". At every point in the Dialogues we meet with assertions regarding which it is far from clear what they mean, or whether Plato agrees with them, or has any clear opinion about them. This is of course the case in the earlier Dialogues where Plato's obvious aim was to recreate the content and atmosphere of the inspired sophistries of his master Socrates. But the Middle Period Dialogues, such as the *Republic*, the *Symposium* and the *Phaedrus*, are likewise the most hinting of documents: they repeatedly suggest that something is being treated in an extremely cursory manner, that it would have to be dealt with elsewhere in much greater depth, e.g. the nature of the Good in *Republic* 506, or of the objects of various mental faculties in *Republic* 534. Plato repeatedly takes refuge in myth, he is whimsically evasive and so on. And in the later Dialogues the difficulty of interpretation is so profound, that it has not been agreed whether their tendency is to undermine or to buttress Plato's characteristic Middle Period doctrines, and in the case of one of the greatest, the *Parmenides*, opinions range from those of Hegel and Proclus, who see in it the supreme expression of Platonic metaphysic and dialectic, to those who would see in it no more than a somewhat frivolous polemical or logical exercise.

All this is very regrettable when we really know from the testimony of Aristotle, despite all his immense misunderstandings, the basic outlines of what Plato taught in the Academy, doctrines that must have been current when Aristotle first joined the Academy in 367, and not, as has been supposed by those who defer too much to the Dialogues, at a much later date, and which impressed Aristotle so deeply that they became for him the very pattern of Platonism, to whose criticism he devoted two complete treatises, one *On the Ideas* and one *On*

*the Good*, the remnants of which are to be found in the *Metaphysics* and in the comments of Alexander and other commentators. From this material we know that Plato, as far back probably as the time of the *Republic*, had replaced the moralisms of Socrates with a thoroughgoing mathematicization of all the Forms, and had come to see in them complex, many-dimensional patterns of numbers and numerical ratios, and believed in some sort of logical procession of all of them all from a supreme Principle of Unity which was also a Principle of Goodness. This Principle of Unity exercised mastery over another Principle of indefiniteness, continuity and badness, and gave rise to the Forms, and it then operated on a second version of the same indefiniteness, continuity and badness, thus giving rise—by way of the soul or souls, which were themselves pure exemplifications of ratio—to the numberless instances of ideal natures that confront us in the world of change and becoming. How Plato expounded these doctrines, whether by formal lecture or informal seminar or tutorial conversation, we do not know, but that they were the important part of Platonism, to whose understanding and refutation Aristotle devoted great pains, we do indeed know. And nothing that Cherniss has written to suggest how the Dialogues may have been misinterpreted to yield the materials for Aristotle's two tomes of criticism, can hold water against the solid uniformity of the Aristotelian testimony as to basic Platonic doctrine. It is not, however, my task this evening to expound the Inexplicit Doctrines of Plato: that I hope to do in a book that will be published before long. It is not my task, because much of what Aristotle said Plato taught was as unclear to the Neoplatonists as it has been to many among ourselves. They arrived at their view of Plato's teaching by painstakingly dotting the *i*'s and crossing the *t*'s of the Dialogues and Letters, and connecting Plato's doctrines with what were undoubtedly Aristotle's modifications of them, e.g. the Aristotelian notion of Matter. If we are sure, as we should be sure, that Plato *had* an inexplicit doctrine or rather programme of investigation, we can come to be sure that Saccas and Plotinus were not deceived as to much of its main outline.

I shall now go through the several characteristic doctrines of Plotinian Neoplatonism and try to show that they repre-

sented no important deviation from the doctrine of Plato. As you well know, the first of the Divine Hypostases in Neoplatonism is a Principle which is indifferently called the One or the Good. In calling it the One, we are not, however, saying that it *has* Unity as other entities, e.g. an army, an organized body, even a soul, have Unity, a Unity which entails that they hold together as entities, and do not wholly disintegrate and cease to be: it does not even mean that it has Unity as the various features which make up an *Eidos* have Unity, or as the mind which envisages *Eide* and their interrelations has Unity. The Supreme Hypostasis of the system does not *have* Unity, but *is* the Unity which all other things that are, have in varying degree: it is therefore of a wholly different order from the things which merely have Unity. And since having Unity is tantamount to being, the supreme Unity cannot properly be said to be: it is what confers being on its participants but cannot for that reason be one of them or among them (see e.g. VI.1.3). And since it has no definite form or definable nature, Unity itself cannot properly be said to be an object of knowledge, and can neither be written of or spoken of: we can at best gesture in its direction, and by simplifying ourselves and abandoning what is specific or individualizing in us, achieve a presence, coincidence or contact with such Unity (VI. 9. 4. 11). The One is, however, also called the Beautiful (I.1.9), but obviously this is an extrinsic denomination, applicable because, through the forms to which it gives unity and being, it also gives beauty to their instances, and so in the realm of Forms themselves throws beauty before itself like a garment (I.1.9). Plotinus indeed says (V.8.11) that the best way to be in beauty is, not to see it, but to *be* it, but plainly such a being beauty, is supraaesthetic rather than aesthetic. Even the title 'Good' is arguably an extrinsic denomination; the Good is so called because it throws a glow on all it produces and awakens desire in those that see this, and because it is the ultimate object of desire for all beings (VI.7.22,23,27). The Good is not, however, a Good to itself, an object of desire or love to itself, though it may be useful for certain purposes to talk as if it were (VI.8.12,13). Plotinus is further clear that the One involves in itself the *power* of everything (V.4.2), and that it can confer

unity and being on all of which it represents the power, and that it has in fact exercised and is always exercising that power. It is further the case for Plotinus, that, being the Good, it logically *must* confer unity and being on inferior things. It will not be what it is if there is not something which enjoys a secondary life which derives from it (II.9.3). This logical necessity does not, however, involve anything like desire or need (V.5.12), and is of course reconcilable with perfect freedom in the sense of an absence of all compulsion.

How now does all this accord with the assertions of Plotinus's master, Plato? Plato, the pupil of Socrates, obviously had to put the Good at the head of the eidetic and the cosmic order, but at even an early phase it was fast assuming the character of an ontological, cosmological and mathematical principle rather than an ethical one. Perhaps one should rather say that its ethical properties were being absorbed in its mathematical ones. And it was fast taking on the hues of transcendent mystery and ineffability that hung round the Good of the Megarians, with whom Plato we know had close relations, and for whom the Good was an Eleatic Unity, capable of carrying many names (Diogenes Laertius, II.106), without thereby involving any inner plurality. Plato's relation with Parmenides was always, we may say, a relation mediated through his Megarian friend Eucleides. Even in *Phaedo* 98ff, the Good is a mysterious principle of cosmic explanation rather than an ethical one, and is more hopefully approached through the assumed being of its shadows, the Forms, regarding which some specifically arithmetical problems are raised, and which, it is suggested, will lead us up to the self-sufficient Good itself. The Good is not to be used to explain things in the naively teleological manner that Socrates tried in Xenophon's *Memorabilia*, though Plato cunningly insinuates that it might, and so has led many commentators up the garden path. The mysterious character of the Good in the *Republic* need hardly be documented in detail. Banal ethical approaches in terms of pleasure and knowledge are repelled, the Good is made responsible for the truth and being of the Forms but transcends this being in dignity and power. If it is called a Form, it is only so called by courtesy, and if we are said to have knowledge of

it, the close connection of knowledge with being is such as to prove that this must be more than an ordinary case of knowledge. And that the whole educational ascent to the dialectic which is to lead on to the Good is through a series of purely mathematical studies, provides plain proof that dialectic is basically a philosophy of mathematics, and that the Good in which it culminates can be nothing but Absolute Unity itself. It is quite inconceivable that Plato's Guardians, having reached the ripe age of fifty, and having studied all the intricacies of mathematics, should be subjected to the ethical argy-pargy practised by Socrates on young men and boys. What Plato *says* may lend itself to such interpretation, but what he *does* with his concept shows that it has quite a different content: if the Good is an ethical concept, it is so in a sense that no mere moralist could comprehend. The Absolute Beauty of *Symposium* 211a,b is in no different case, being "neither words, nor knowledge, nor anything pertaining to anything else," but subsisting itself by itself in eternal unity, no matter how its scattered participants wax and wane. When one remembers Plato's close association of beauty with regular mathematical measure and proportion, it is plain that the Beauty here dealt with is simply Unity itself. There is no harm in finding this aesthetically moving.

If we now demand an actual carrying out of the dialectical programme, arguably we have a somewhat joking execution of it in the second part of the dialogue *Parmenides*, where the transcendental character of Unity itself is shown by the fact that, as in the case of the Megarian Good, it has a being-in-itself in which nothing except itself can be said of it, and that it yet also has a being in and for others in which everything can be said of it, and it said of everything, and which is so necessary to all such others that without it they would resolve themselves into sheer formlessness or into nothing at all. I am not, however, so foolish as to think I can pack a good interpretation of the *Parmenides* into a single sentence. In the *Philebus* finally the Good hides itself in a forest of transcendentals among which notions like Measure, Symmetry, and Proportion are prominent: beneath these the Forms are ranged as specific cases of such transcendentals, and far beneath them such human values

as knowledge and pleasure. I think it arguable that Plato's thought moved towards the same unification of transcendentals as the Megarians, and that in this unification a transformed mathematical principle quite absorbed the principles of ethics and aesthetics. This also is the doctrine of Plotinus. The references to the Father of the Cause in Epistle VI may also be regarded as authentic, and so may the adjuration of Dionysius in Epistle II not to ask too many questions regarding the supreme Unity.

From the Father of the Cause I turn to the Cause. otherwise, in Plotinus, to the Divine Mind or Intelligence, the Second Hypostasis, surrounded by secondary things. As you all know, Plotinus makes the Divine Mind a double-barrelled affair, whose two sides are welded into inseparable unity. It is a subject-object unity consisting on the one side of the *Noeta*, the *Eide*, on the other side of the *Noeses*, and also the *Noes* or *Noi*, the thoughts and the minds directed upon the *Eide*. The *Nous*, Plotinus tells us, is a necessary *Perilampsis* or irradiation of Unity: it in fact is Absolute Unity separated from itself only by Difference, and returning to itself from Difference (V.1.6). The power of the One is seen by the *Nous* as strung out into different forms: this is how the *Nous* must necessarily see the One. The One in a sense feels all the things that lie in its power, and these the *Nous* distinguishes, defines, and stabilizes, and will not allow to float about in indefiniteness (V.1.7). Mind in fact is a necessary outflow of Absolute Unity: Unity requires Mind logically, and is incomplete without its disceptive diligence, though it does not *need* Mind in the desiderative sense, as Mind needs it. Mind and the *Noeta* it contemplates are held to be inseparable: there is in Mind no reaching out to objects beyond itself that is so characteristic of Soul, with its need, also, for the pricks of external sensuous realities. Aristotle, Parmenides and Heraclitus are invoked to attest the close marriage of *Nous* and *Noeta*, but strangely enough not Plato himself. Mind is entirely coeval with the forms it knows (V.9.7), which does not, however, prevent Plotinus from constructing temporalized accounts in one of which would otherwise be indefinite and random, and according to the other of which (VI.7.15) the multiplicity of the *Noeta* is due to the

Mind's inability to envisage the supreme Unity, and to its consequent need to split this up into a number of distinct unities of *Eide*. In the Nous, further, all the *Noeta* are together, but can, when needed (for purposes of the Soul) be held apart from one another (V.9.6). This unity in which each is all, and all is all, and the glory infinite, is given lyrical acclaim in the well-known treatise on Intelligible Beauty, the Western equivalent of the Buddhist *Avatamsaka Sutra*. But the supreme Mind also includes minds (in the plural) in its perfect unity (VI.8.17); these are perhaps the eidetic originals of particular minds. It is in fact clear that since the Nous has no principle of individuation, and since it is out of time, it is not really a Mind at all, but rather the unique, eternal *Eidos* of Mind as Such, in which particular minds, including the mind of the World Soul, merely participate. Some doubt might be cast on this interpretation because Plotinus in V.9.13 seems to question whether there can be *Eide* of Soul and Mind. What the passage really says, however, is that particular souls and minds are less definitely distinct from their eidetic originals than sensible instances are.

How does the Plotinian doctrine of the Second Hypostasis fit in with the teaching of Plato? Does Plato believe in a timeless eidetic Mind which embraces the *Eide* and is one actuality with them, or is this doctrine derived from Aristotle's Active Intelligence, always one with the immaterial *Eide* that it thinks, and perhaps identical with the thinking on thinking we meet with in God, who thinks all things in thinking only Himself? Is the intrusion of an essentially Aristotelian view into Platonism part of the syncretistic homodoxy which Saccas erroneously introduced? Even such a deep modern interpreter of Plato as Kramer thinks that the *Geistesmetaphysik* starts with Plato's successors. I, however, am of the opinion that the *Geistesmetaphysik* was propounded orally by Plato himself and is documented clearly in his writings, the only reason why Plato did not proclaim it from the housetops being that he did not wish his doctrine to be confused with the doctrines which Aristotle was even then excogitating, according to which the supreme Mind is a high-grade instance of mentality and not mentality itself, the doctrine of course which gave comfort to all those in

the Middle Ages who believed that the *Eide* could find safe harbourage in the mind of God. For Plato, however, I should hold, the Mind correlated with the *Eide* was a Thinkingness rather than a Thinker, and provided no anchor for those who demand an ultimate concrete, whether mental or anything else.

What reason have we to hold that Plato believed in an eternal Thinkingness and Livingness which were higher than the thought and life present in souls? If we read the *Phaedo* carefully, we shall see how the soul is never fully identified with the Form of Life, which it none the less imparts to its instances. If souls impart life to bodies, Life Itself imparts life to souls. If we now turn to the first Sun-passage in the *Republic*, we find it said that, as the Sun is responsible both for sight and the seen, so the Good is responsible both for Mind and what it minds, both for knowledge and for truth. It is of course plain that Plato is here explicitly speaking of instantial minds that know the true being of the *Eide*, but can it be doubted, if the parallelism is to be meaningful, and Plato not idiotic, that there must be an *Eidos* of knowledge or Intelligence correlated with the ideal unities, just as there is an instantial organ of vision correlated with instantial colour, and that souls only come to knowledge of the *Eide* through participation in this Absolute Idea of Knowledge? And if we turn to the Line, this conjecture is amply confirmed, for here there are mental powers correlated with all the objects we can know, and Plato cannot have been so blind or so silly as not to perceive that there must be Forms of characteristic mental exercises and powers as well as of their objects. Plato in fact provides us with forms of the mental faculties inferior to knowledge as well as of pure intellection, just as he for similar reasons, in Books VIII and IX of the *Republic*, provides us with Forms of deviant and pathological states. But that Knowledge at least had eidetic representation is plain from the passage in *Phaedrus* 247d,e where the souls in their upper-world journey are said to behold the form of Knowledge Itself, and it is even clearer in the passage in *Parmenides* 134 where Knowledge Itself and Mastery Itself are correlated with other eternal *Eide*, which are argued to be inaccessible to instantial knowers and masters, whereas, God, the non-instantial Knower and Master par excellence, can have

no relation to sensible, instantial things. A careful reading of the *Philebus* will likewise show that while it acknowledges the presence of Mind in the cosmos, responsible for all its regularity, and present in the royal soul of Zeus, there is yet said, in carefully chosen language, to be a "Power of the Cause" which has conferred mind and soul on Zeus and the other divinities, a power, therefore, which though of the nature of Mind, is not an instance of Mind, and can obviously be none other than Mind Itself, in association with Life Itself, the eternal Living-Thinkingness which lies way back of all minds and souls and what they envisage. The *Timaeus* in its carefully managed mythology tells the same story: the Demiurge is not the mind or soul which moves the heavens and thinks all the forms and their actual and possible instances in endless cyclical enjoyment. He is an elder, timeless being, hard to know or declare, the essential cognizer of the Forms of life and all other Forms these may involve, and responsible for the being of the soul and for bodies that the soul moves in time. This Demiurge again is our old friend, Thinkingness as such, eternally trained on all thinkables, and welding them all into one vision. And if one questions whether Plotinus is not borrowing from Aristotle when he makes *Nous* and *Noeta* sides of a single reality, let us remember the possibility that Aristotle may have been plagiarizing from Plato when he taught a similar doctrine. Philoponus at least, a Christian commentator on the *De Anima*, says that the Aristotelian reference to someone who called the Mind the place of Forms was to none other than Plato. Only for Plato this Mind cannot have been a mind, but only Mind Itself.

If we now turn to the third Plotinian Hypostasis, Soul, there is much less discrepancy to adjust between what Plotinus and his master Plato say. The generation of Soul coincides, for Plotinus as for Plato, with the generation of Time. Just as the eternal Mind arises out of the supreme Unity by the holding apart of the *Eide* of which it is the power, so Soul and Time arise for Plotinus out of the eternal Mind by a departure from the completeness of the ideal sphere, which permits of neither addition nor subtraction. This departure from completeness is identical with the life of Soul, an essentially unquiet faculty, like Martha busy over many things (*πολυπράγμων*, III.7.11) and

forced to decode the total message of the *Eide* into a long string of separate messages, each of which it laboriously fits into a growing whole. Plotinus does not, however, regard this declension into temporality as an unfortunate accident: plainly it is as logically necessary for the ultimate Unity to give rise to the mobile, questioning Soul, as excellent in its rule-governed everlastingness as anything temporal can be, as it was necessary for it, at a higher stage, to differentiate itself in the *Eide* and in the Mind which is the thought of them all. Soul, further, involves a less transparent pluralization than exists at the level of Mind and the *Eide*: our souls do not interpenetrate as do the eidetic minds above them, and have something of the separateness of the bodily masses in which they are active (IV.1.11). There is also somewhat of a gulf between them and their Great Sister, the All-Soul. But, though thus separated in their lower being, souls remain linked together at their highest points, much as light divides itself among separate dwellings, while remaining undivided and truly one (IV.3.4), a beautiful image reminiscent of a passage in the Platonic *Parmenides*. And the All-Soul is of course responsible for the unending turning on itself of the heavens, and for the accompanying thought-circuit through the realm of Forms.

If we turn to Plato, most things stay the same, except that some questions are left unexplored, and mathematical exactnesses are added which are foreign to the genius of Plotinus. The Soul is the mediatrix between the eternal, undirempted Forms and the changeable dirempted sensibles: it has appropriate ways of knowing both spheres, and it is also the vehicle through which the Forms, the ultimate true causes of generation and becoming, become sources of motion in the instantial world. All movements which are externally initiated stem from movements that are self-initiated, and these are the movements characteristic of Soul, which is therefore the source, under the Forms, of all movements in the instantial world. And Soul is equally involved in the perpetual inner circlings of thought and perception about their objects. The great distinction of Plato is, however, as I have said, the belief that the proportions and rhythms and numerical relations which the Soul cognizes in things, and imposes on them, are all mirrored in Soul-structure.

The Soul is a complex structure of numbers, like the things it cognizes and manipulates. This, the doctrine of the *Timaeus* and also referred to in well-known passages in the *De Anima*, comes strange to modern thought, as it also doubtless came strange to the less mathematical Neoplatonists. But it is entirely defensible. Cognition and action may not be exhaustively analysable in terms of numbers and ratios, but they are certainly not intelligible without these. Everything that is objective or subjective is a matter of style, whether existence-style or life-style or thought-style, and style is without doubt a matter of proportion and number.

Beneath Soul, for Plotinus, lies Matter (ὕλη) into which Soul pours the *Logoi*, the ratios, which form the essences of the various species of natural being. Regarding Matter Plotinus has a long, interesting treatise (II.4) in which the Aristotelian accounts of *Hyle* are subtly combined with the accounts of the Receptacle in the *Timaeus*, and with the Aristotelian accounts of the Platonic Great and Small. This is a field in which there is genuinely a profound homodoxy between Plato and Aristotle, the Prime *Hyle* of Aristotle being only in name more substantial than the empty receptacle of Plato. Plotinus follows Plato, as also Aristotle, in recognizing an ideal as well as an instantial matter: the indefinite substrate, which is what is common to all the *Eide*, reappears, at another level, in the basic indefiniteness which underlies sensible instances. Sensible matter, we are told (II.4.6), is required to give bulk to the being of sensible things, which cannot consist in pure form, and to explain the continuous transformation of sensible things into one another. To this omnirecipient Prime Matter Plotinus denies not only every sensible quality, but even bulk (ἄγκος) and size, thereby going beyond Plato's treatment of *Chora* in the *Timaeus*. But Prime Matter, though not intrinsically bulky, has none the less an intrinsic *aptitude* for size and distance. How is such matter apprehended? Like the nothingness of space, not so much by a spurious act of thinking, as by the complete failure of such an act, that is by an indefinite unthinkingness *anoia* in which no clear content comes to light (II.4.10).

Why do souls descend from the intensive parcelling involved in temporal process into the extensive parcelling

involved in bodily extension and existence? The Plotinian answer is simply because they are souls, and because, stemming from Absolute Unity, and having in themselves an image of the Unity which abides through flux, they necessarily desire to preside over and impose unity upon a disunity which is further from Absolute Unity than themselves. Necessarily this descent of Soul into the otherness of bodily being entails endless possibilities of defect, miscarriage and corruption—which do not, however, touch our august sister, the World-Soul—and necessarily the Soul must seek to raise itself to the patterns yonder, and to the Unity from which they radiate. But it is only by descending from the supreme Unity that it is possible to return to it, and the descent is in consequence not something misjudged or wanton, even though it may metaphorically be said to involve *Tolma* or audacity. Plotinus, as is well known, magnificently defended the natural world against all those who, like certain Christian Gnostics, would regard it as the evil product of a fallen power. Being an instance, it necessarily falls short of its original, but, for an instance, nothing can exceed its beauty and accuracy (II.9.4). All this is said with less fullness in Plato. It is plain that the Divine lack of *Phthonos* or envy in the *Timaeus* is merely a pictorial way of expressing a logical and ontological relation. The timeless perfection present to eternal Thinkingness must, being what it is, seek to carry itself out in the changeable, dispersed, randomized medium of the instance. Being, as the *Sophist* teaches, entails the possession of power. Instantiation is therefore nothing that can or ought to be dispensed with, but it carries with it mutability, externality and chance interferences of all sorts: all that can be done is to resist these disintegrating forces, to make them as little disruptive as possible. This our cosmos, with its everlasting background regularities, and its recurrent restoration of order whenever things get too bad, magnificently achieves, both for Plato and Plotinus. I myself humbly share their logical optimism.

I shall end this paper by dwelling on a few respects in which I think that Plato was a richer and greater philosopher than his Neoplatonic interpreters, and also a few respects in which I think that they were better philosophers than he was. It

was, I consider, a great misfortune that the Neoplatonists made the eidetic realm a realm of unmixed perfection, thereby according with a drift in the Academy according to which there were not Forms of everything, but only of certain special, privileged things. Quite plainly this Academic restriction does not accord with the *practice* of Plato who speaks of forms of impiety, injustice and other negatives, and who also devotes two whole books of the *Republic* to studying the deviant forms of the state, deviations not due to chance, but to numerical cycles rooted in the nature of things. Plato in the person of *Parmenides* likewise reproves the doctrinaire Socrates, his former self or some right-wing contemporary, for refusing to admit forms of hair, mud, and filth. There is, however, a line of evidence stemming from a long passage of Sextus Empiricus dealing with Pythagorean and Academic doctrine, and from references in the Aristotelian commentators to one Hermodorus, who wrote a contemporary study of Plato's doctrine, which goes some way towards resolving the discrepancy between the Dialogues and the Aristotelian reports on these points. Plato, it would appear, had come to admit *three* categories of forms: one of self-existent, standard types which obviously occupied a prime place in the ideal order, one of opposites or negations having obviously only a secondary place, and one, lastly, of "relatives", by which it is plain that Plato intended deviations from standard types by way of excess or defect. This doctrine, if we are interpreting it rightly, perfectly explains Plato's practice in the Dialogues, and what Aristotle says of his doctrine in the *Metaphysics*. For it would seem that, while Plato only gave prime status in the world of Forms to models of perfection, he gave secondary and tertiary status to partial or total deviations from such models: these were, after a fashion, involved in the sense of the models from which they deviated, and enjoyed a charter of liberty in the realm of instantiation. (For the material see Sextus Empiricus *Adversus Mathematicos* 248-283, and Simplicius on Aristotle *Physics* 192a). Had the Neoplatonists known of these doctrines, they would have spared us some of the overrestatic accounts of life in the intelligible world, where there is not even a breath of what Hegel called "the seriousness, the suffering, the patience and the labour of the negative". In Plato's later writing

transcendentals fade into the background where their illuminative role plainly lies: while there is no evidence whatever that Plato ever lost his faith in his supreme Unity, his attitude towards it became less appallingly light-headed. Lightheadedness, however, is a characteristic of Neoplatonism, and like St. Teresa one has, in studying them, to fight against unwanted levitation. It is also a defect of the Neoplatonists that they failed to make much sense of Plato's attempt to "mathematize" the forms, to reduce them to numbers, proportions and patterns of the same, an attempt in which Platonism went far towards anticipating the temper of modern science. In the *Tractate on Numbers* which occurs in the Sixth Plotinian Ennead, there is much treatment of plurality, but hardly anything that concerns numbers as such.

On the other hand we may regard it as a great merit of the Neoplatonists that they systematically side-stepped the rigid use of the concepts of negation and diversity which is characteristic of what we may call "logic-chopping", which Plato inherited from Socrates, and from which he may never wholly be able to free himself. The soul, e.g., must have three parts because it does three disparate sorts of things, and there must likewise be three sorts of entity in the world, Forms, Sensibles and Space, trichotomies which delight those who like to deduce pluralism from some such principle as that "Everything is what it is and not another thing". Plotinus, however, is clear that his Hypostases are not rigorously distinct, but can slide into, and be transformed into one another, and that everything that is yonder is also here, and vice versa. Difference is for him something like the Hegelian "alienation" which can never be carried to a limit. Everything is indeed what it is and not another thing, i.e. everything is the one and only true Unity.

To sum up. The Neoplatonism of Plotinus was not a distortion of Platonism but a liberation of the main structures in the Platonic ontology from its Socratic carapace, and from the necessary limitations of the literary dialogue. Plotinus offered posterity the essence of Platonism, and as such it became an infinitely precious strand in Christian theology which, even when verbally critical of Plato, remained profoundly indebted to him. This essence has, however, largely

been lost by the modern refusal to go beyond the letter of the Dialogues, or to do so only when the results accord with what we may call the "Here we go round the mulberry bush" of modern analysis. Plato and Plotinus should be studied together: the second provides an essential commentary on the first.

## Plotinus' Adaptation of Aristotle's Psychology: Sensation, Imagination and Memory<sup>1</sup>

by Henry J. Blumenthal

*University of Liverpool*

That the *Enneads* contain a great deal of Aristotelian doctrine must be obvious to a fairly casual reader even without the explicit testimony of Porphyry.<sup>2</sup> Nevertheless it is not equally obvious in all parts of Plotinus' thought – sometimes, of course, he is in clear disagreement with Aristotle. For various reasons which we shall have to consider the use of Aristotle's ideas in the construction of Plotinus' doctrines of the human soul is pervasive, but does not present us with a simple case of absorption. That, in the nature of the case, would have been impossible, even if we forget Plotinus' capacity for subtle alteration of views, he might at first sight appear to be taking over as they stood, a process which Professor Armstrong has aptly called 'rethinking',<sup>3</sup> but which might well appear as perverse interpretation. Plotinus, as is well known, claimed to be doing no more than expounding views whose antiquity could be vouched for by Plato's own writings (V.1.8.10-14). Many have referred to this claim in connection with Plotinus' relation to Plato. It is perhaps not equally well understood that a man who could think himself so good a Platonist would have been quite capable of thinking that those parts of his psychology which were Aristotelian were roughly the same as those of his source, or more importantly perhaps, that Aristotle's views were the same as his own. His attitude is not unlike that of those Aristotelian commentators who were later to claim that Aristotle's views were like Plato's if only one understood them aright.<sup>4</sup>

I have made these points at this stage because the basis of Plotinus' psychology is a paradox which, I suggest, can only be understood if one thinks in such terms. The paradox lies in the fact that Plotinus' soul was, like Plato's, separate from and, ideally, opposed to the body, but worked like Aristotle's which was by definition the body's essence. And yet Plotinus was well aware of the crucial difference: he did not fail to criticize Aristotle's entelechy theory, and of course attacked both his definition of the soul and its implications (IV.7.8<sup>5</sup>).

That the body: soul relation was Platonic and dualist is stated nowhere more clearly and emphatically than in the first lines of IV. 3.22: 'Should one say then that when soul is present to body it is present as fire is to air? For that too when it is present is not present, and when it is present all through a thing is mixed with none of it: it remains unmoved while the other flows by'.<sup>5</sup> The independence of soul which this text asserts is not always preserved in practice. One might think of Plotinus' warnings about the consequences of the affections (*πάθη*), and, in general, the way he regards the lowest phases of the soul as quite closely linked with the body, and always liable to suffer from the association, an association which is even capable of having undesirable effects on the soul's higher ranges (cf. e.g. IV.8.2.26-30, VI.4.15.18ff.)<sup>6</sup>. This is so in spite of the careful way in which Plotinus will, for example, talk of the desiring faculty as having the basis of its action in a certain part of the body, namely the liver (IV.3.23.35-40) – a point, incidentally, on which Plotinus is in a sense more Platonic than Plato, who puts the equivalent 'part' of the soul in the abdomen as if it were a lump of matter.<sup>7</sup> Here it would seem that Plotinus was more scientific, and thus more in sympathy with Aristotle's approach, than his professedly Platonic position should have allowed.

The fact that Plotinus used Aristotle's account of the soul's operations, and, of course, his general view of the way the soul should be divided, while differing with him over the whole basis of psychology, namely what the soul was and how it related to the body, accounts for a large measure, though certainly not all, of the differences between their views about its functions. There are, of course, others. One is Plotinus' view

of the soul as a reflection of higher being, itself as a whole dependent on what lies above, and with each phase or section depending on that above and less valuable than it. Here ethics and metaphysics invade psychology. Thus soul for Plotinus is viewed from the top downwards, and lower sections are sometimes regarded as dispensable. When soul is functioning as it should and so looking upwards, the lower section is absorbed in the higher: one might think of a kind of hanging collapsible cup.<sup>8</sup> In Aristotle the situation is reversed: the soul is like a pyramid, where each layer, or series of faculties, cannot exist without that below. As a result Plotinus tends to consider any function of the soul at least partly against the background of its possible contribution to man's upward progress, and perhaps to evaluate it in this light.

Aristotle on several occasions records that there is a progress through the lower to the higher forms of cognition and knowledge, not thereby implying that the 'lower' forms are 'worse' than the 'higher'.<sup>9</sup> His aim is to analyze how one acquires knowledge and he makes it clear on numerous occasions that sense-perception is the indispensable foundation of the process. This no Platonist could admit, though Aristotle's own Platonism does re-assert itself in the view that at the end of the process we have knowledge of things inherently more knowable than the sense-data from which it starts. Here we see one example of Aristotle's different approach, which also shows itself in his more scientific attitude to psychology. Put quite simply, he wants to analyze the functions of soul wherever in the world it might operate, and is particularly interested in the demarcations between various forms of life. Plotinus, unlike Plato, does see, and has perhaps learned from Aristotle, that soul extends to all forms of life (cf. I.4.1.18ff.) – and even finds it in things that Aristotle properly regards as inanimate (IV.4.27) – but he is not really interested in those other than man. It should not be forgotten that, whatever others made of it later, the *de Anima* is a biological treatise.

The differences we have outlined are perhaps most interestingly studied in the middle section of the human soul, at the levels of perception, imagination and memory. The top and bottom are less instructive, for the following reasons. At the

top, at the level of *nous*, Aristotle's soul, or at least the active *nous*, is also detached from the body. I shall avoid for now the problems that would be presented if the passive *nous*, whose nature is defined as pure potentiality, were the highest manifestation of the body's actuality, and the no less troublesome matter of the exact level where Plotinus' human *nous* is to be situated. Whether the answer be the hypostasis *Nous* or the hypostasis Soul makes little difference for the present purpose.<sup>10</sup> But in any case this is another area where Aristotle is closer to Plotinus' intentions as well as his practice by virtue of a Platonic feature of his thought. If Aristotle's active *nous* were after all one of the 'intelligences', then Aristotle and Plotinus are here very close.

At the bottom of the scale the two thinkers are again fairly close, but whereas at the upper end of the scale this is explicable in terms of Aristotle's Platonism, at the lower end it is to be seen as a result of Plotinus' apparent Aristotelianism—unintentional though it may have been. Especially at the level of the vegetative soul, which both Aristotle and Plotinus call by a variety of names, what is done by soul in Aristotle is the work of body alone in Plato. Moreover, as soul descends, or reflects itself, further downwards, it becomes more and more closely bound up with body until its function becomes the information of previously formless matter (VI.7.7.8ff.). Here in producing body, the soul is functioning as world-soul: sometimes it is also seen as a manifestation of world-soul at the next level, that of the vegetative soul.<sup>11</sup> Here the gap between body and soul, whether regarded as world-soul or individual soul, is small enough for Aristotle's ideas not to be far removed from Plato's, though of course their professed positions were no less different than elsewhere.

The way both may make the same kind of statements for different reasons is well illustrated when Plotinus, discussing the impassibility of soul when involved with the affections, says that if we say the soul changes in the emotions we are liable to be doing the same sort of thing as if we were to say the soul goes pale or blushes, without taking into account that these things happen through the soul but in some other structure, that is, the body (III.6.3.7-11).<sup>12</sup> Aristotle had compared the notion that the soul is angry with the view that it builds or

weaves, and thought it would be better to say not that the soul feels pity, learns or thinks, but that it is the man with his soul that does these things (408b 11-15).<sup>13</sup> Aristotle is concerned to make it clear that the soul does not act independently of the body whose form it is. Plotinus, on the contrary, wants to show that the soul is independent of the body with which it is merely associated.

This requirement is still operative at the level of sense-perception. It is perhaps what made it possible for Plotinus to arrive at the fairly clear distinction he makes between sensation and perception, equipped as he was with no better linguistic tools than his predecessors.<sup>14</sup> Of these none, as far as we know, made the distinction with any clarity. Plotinus did it simply, though perhaps crudely, by separating sense-perception into an affection (*πάθος*) of the body, and a judgement or act of cognition on the part of the soul. So, for example, at the start of III.6: 'We say that perceptions are not affections, but activities and judgements concerning affections: the affections take place elsewhere, let us say in the body so qualified, but the judgement is in the soul, and the judgement is not an affection — otherwise there would have to be another judgement, regressing to infinity — but we still have a problem here, whether the judgement *qua* judgement takes on anything from its object. If it has a mark from it, then it has undergone an affection.'<sup>15</sup> There are, of course, other places where Plotinus points out that the faculty of sensation is not affected by what happens to its organs, or to the body in general. So at IV.6.2.16-18 he says that in the case of taste and smell there are affections and also perceptions and judgements of these which are a cognition of the affections, but not identical with them.<sup>16</sup> Perception in general is the soul's judgement of the body's affections (IV.4.22.30-32). But the introduction to III.6 is particularly significant when considered in its context. The whole purpose of the first part of this treatise is to show that the soul is not changed by the emotions (cf. esp. III.6.1.12-14); these being functions of the soul below the sensitive faculty are of course more likely than sense-perception to have some effect on the soul itself. What happens in perception is used as a paradigm of the soul's freedom from the affections of the body

and its separation from it. Later in the treatise vision is used to illustrate another point, this time to show how the lower parts of the soul may listen to reason without actually being changed: vision, he says, is simply the actualization of a potency. The act and potency are in essence the same, and so vision entails no essential change: the sense cognizes its objects without undergoing any affection (III.6.2.32ff.). Here we can see clearly what Plotinus is in fact doing: he is discussing sense-perception for the light it can throw on other matters. The two points he wishes to make here are that there may be temporary changes involving parts of the soul either in relation to others, or to the body, and that changes in the body need not, and generally do not, affect the soul. In the area of the affections he does not quite succeed.<sup>17</sup> Elsewhere he will use his basically Aristotelian view of vision as a pattern for the relation of various levels of reality.<sup>18</sup> Its usefulness here, rather than just the normal Greek feeling that vision was the most important sense – stated explicitly by Aristotle at *de Anima* 429a 2f. – is the most likely reason for Plotinus' interest in vision. If this explanation is correct it becomes less surprising that for Plotinus sensation is almost synonymous with vision: he says very little more about taste and smell than the remark we have referred to, virtually nothing about touch and gives a short account of hearing, again primarily illustrative.<sup>19</sup> A sound fills the air for anyone who is there to be able to hear it, and the whole sound is in any one part of the air: that is how we are to understand the presence of soul (VI.4.12). This kind of paradigmatic purpose is at least part of the reason why the distribution of Plotinus' discussions of perception is so different from Aristotle's. There is of course more to be said. In his treatise *Problems about the Soul* (IV.3-5), as well as in one or two specialised smaller treatises, like that on why large objects perceived at a distance appear small (II.8), Plotinus does seem to be interested in the workings of the human soul for their own sake. This is perhaps also true of I.1, but only to an extent, for there Plotinus is primarily concerned with making a distinction between those human activities which involve both body and soul and those which are the work of soul alone.

Such then are the reasons for Plotinus' uneven coverage of the questions that present themselves. What of the details? As

far as their general notions of what happens in sense-perception go, Aristotle and Plotinus are not very far apart. Aristotle says that each sense is 'that which is able to receive the sensible forms (i.e. of sense-objects) without their matter',<sup>20</sup> and compares the way wax may receive the imprint of a signet-ring without its material, the metal (424a 17-21). Plotinus' definition is similar, but its intention may be subtly different. For him sense-perception is 'the perception of the soul or the 'living being' (*ζῶον*) of sensible objects, the soul grasping the quality attached to bodies and receiving an imprint of their forms' (IV.4.23.1-3).<sup>21</sup> By inserting 'quality attached to bodies' Plotinus causes one to wonder just what he means by the word which is translated 'forms' but can equally well mean appearances. Are 'forms' no more than appearances? That would be in order for a Platonist, but perhaps not in harmony with Plotinus' fairly positive attitude to the sensible world in this treatise, and the distinction may be over-subtle. Nevertheless the impression that Plotinus does mean to indicate the illusoriness of sensible qualities is strengthened by the fact that the word he uses for receiving an imprint (*ἀπομάρτεω*) occurs in that part of the *Timaeus* where Plato describes the production of sensible objects in the Receptacle.<sup>22</sup> In any case Plotinus is perhaps closer to Aristotle in another passage, III.6.18.24ff., where he talks of soul not being prepared to accept the forms of sensible objects with multiplicity but seeing them *when they have put off their mass*,<sup>23</sup> if by this he means something like Aristotle's 'without matter'.

Where Plotinus certainly differs from Aristotle is in his view that the soul's power of perception is not properly exercised on the sense-objects themselves, but on the impressions which sensation has produced in the 'living being': these have by then become intelligible (I.1.7.9-12). Here we do have a sensation: perception distinction. For Aristotle there was of course no question of a distinction between what is done by body and soul, and so his account was much simpler: the body and soul unit perceived sensible objects by means of the appropriate faculty, the sensitive, acting through, or in, the appropriate organ. In fact, faculty and organ are the same, except in definition (424a 24-6).

The role of the sense organs was in line with the general requirements of the two thinkers' approaches. In Aristotle's psychology it was possible, not to say desirable, for the organs to be independently active. Vision is, after all, inherent in the eye. It is its form and essence: an eye that cannot see is simply not an eye (412b 18-22). For Plotinus, on the other hand, an eye *qua* part of a body can only see when activated by the relevant faculty of its detached soul, and its function, like that of all the sense organs, is to act as an intermediary, a kind of transformation point, between the sensible objects outside and the immaterial soul 'inside' which is only able to perceive what is presented to it in an intelligible form (IV.4.23). In fact the senses are different only because different sense organs perform this role (IV.3.3.12ff.). By itself soul can only think (*νοεῖν*) the objects which it already possesses (IV.4.23.5f.). Through the sense organs it can be assimilated to the sensible objects (*ibid.* 21ff.), just as in Aristotle's theory the organs, or senses, become like the objects from which they were originally different, though potentially the same (cf. 417a 18-21, 422a 6f.). It should not, however, be forgotten, that for Plotinus the organ must already, if there is to be perception, have a degree of similarity to the object, whether this is described in terms of sympathy as in IV.4.23, or, rarely, more Platonically in terms of being light-like, as at I.6.9.30f. Plotinus' concept of an inward transmission from the organs to the soul as such was of course greatly helped by the post-Aristotelian discovery of the nerves.<sup>24</sup>

A further and immediately obvious difference comes over the question of a medium between object and organ. Quite simply Aristotle thought that one was required while Plotinus did not. This is one of the more technical questions which Plotinus discussed at some length, in IV.5, which is an appendix to the treatise on the soul. Here again he disagrees quite openly with Aristotle, though he does not mention him by name. Plotinus wished to explain the contact between subject and object in perception by means of the sympathy (*συμπάθεια*) that existed between all parts of the world in virtue of its status as a living being, a notion he had taken over from certain later Stoics — dare one say Posidonius? This sympathy operated equal-

ly between the parts of the world and the parts of each ensouled individual in it, which allowed Plotinus to explain both internal and external perception in the same way. That had the advantage of greater economy and simplicity than a theory which required a medium for external perception when there could be none in the case of internal perception. That was a problem which would not have been serious for Aristotle, since he did not, in general, consider what role perception might have in respect of the percipient subject himself. There is, of course, one exception, the attribution in the *de Anima* to the several sense themselves of awareness than they are perceiving. But Aristotle merely says that they, rather than some other sense, see or hear that they are seeing or hearing (425b 12ff.). His main reason is a fear of regress, and he is not much concerned with how the process works. By his own theory there should be a medium, and that could have been a serious difficulty even in the *de Sensu* version where the senses acting together, as the common sense, are responsible for this kind of perception (*de Sensu* 455a 12 ff.). Here then we have one manifestation of Plotinus' interest in various kinds of self-awareness and self-consciousness. This was an area in which Aristotle had taken little interest and where Plotinus was in advance of his predecessors and sometimes foreshadowed modern developments in psychology — as also in his brief reference to the importance of unconscious memories (IV.4.4.7-13).

To return to mediums, Plotinus arraigned two classes of offenders, one whose own theories required a medium, and another for whom it was unnecessary to the concept of perception with which they worked. Aristotle falls into the latter and worse class. Plotinus discusses the question mainly, but not exclusively, in terms of vision. His general view is that there is no need for anything between object and eye to be affected so long as the eye itself is (IV.5.1.15ff.). He here ignores Aristotle's argument from the impossibility of seeing objects placed directly on the eye (419a 12f.), an argument he is quite prepared to use elsewhere for another purpose.<sup>25</sup> Against the idea that air must be changed before we can see, he argues that we should then be seeing the adjacent air, and not the object itself, just as if we were being warmed by air rather

than by a fire (IV.5.2 50-55). This is not the best of arguments. A better one is that if vision depended on the air being lit, that would make nonsense of the fact that we can and do see lights in the dark: this means that the darkness is still there when we see. Plotinus rejects any attempt to salvage mediums by arguing that their absence would break the sympathy between subject and object: he does so by anticipating his final conclusion that sense-perception depends on the sympathy which arises from common membership of one living organism (IV.5.3.1ff.). Before he reaches that he stops to consider the view that air might be necessary if one thinks that light can only exist in air. He points out that the air would then be incidental to the process of vision (IV.5.4.2-7). It is interesting to note that Plotinus has here arrived at a correct position for a dubious reason: we do now know that light can be propagated through a vacuum. Unfortunately for Plotinus the same is not true of sound, whose medium Plotinus wishes to abolish by the same argument. One might wonder, incidentally, whether Plotinus' unwillingness to accept any kind of medium, against which he argues mainly in terms of vision, had anything to do with his views on the exalted status of light. Was light too good to be involved so basically in sense-perception?

One further question must be considered. How did Aristotle and Plotinus deal with the assessment of sense-data by the soul, and what did they think about their objective validity? The first half of the question is perhaps badly framed in the case of Aristotle, given his answers to the second. For in the case of at least one kind of perception, that of the relevant quality by the appropriate sense, such as colour by vision, there was no scope, or very little, for error. Error could arise in the perception of something as an attribute, or, more often, in the apprehension of the common sensibles, such as size or shape (428b 17-25). The latter Plotinus attributed to a combination of perception and opinion (VI.9.3.27-32).<sup>26</sup> Aristotle omits to tell us how error is detected, but it would seem that it must be done by reason working with the images which the sensations produce. This is certainly what Plotinus thought. Incoming sense-data were compared with a pre-existing pattern derived from above (VI.7.6.2-7). Reason dealt with images produced by

perception (V.3.2.2ff.): the percept of a man will set off a chain of inference, and reason by using memory can pronounce that it is Socrates (V.3.3.1-5). But here reason performs a function which in Aristotle was a matter of perception: the sense of sight perceives a white object incidentally as the son of Diaries (418a 20f.). As a result of this difference Plotinus does not need reason to confirm what is its own conclusion. What was in Aristotle a case of perception has become for Plotinus a matter of inference. Some form of verification will, for him, have been necessary even at the level of Aristotle's usually infallible perceptions: as far as Plotinus was concerned, sense-perception produced opinion, not truth (V.5.1.62-5). Here Plotinus' Platonism is clearly responsible for his view.

For Plotinus the faculty of imagination is the terminus for perceptions as such (cf. IV.3.29.24f.). They may be passed on to reason for processing, or retained as memories. Imagination is also responsible for other forms of transmission between parts of the soul, or between soul and body. Its duties in connection with memory are particularly complex. It is probably because of this wide variety of functions that Plotinus tended to see imagination as a faculty – or rather two – in its own right. Aristotle, on the other hand, tended to think of it as a subdivision of the sensitive faculty, different by definition rather than in essence (*de Insomn.* 459a 15ff.). He defined it as a 'movement caused by the activity of perception' (428b 13f.).<sup>27</sup> Nevertheless he will sometimes speak of imagination acting independently of sensation, and in particular producing sense-like images, as in dreams, when no sensation is present. This is one of the differences between imagination and perception that he mentions in the course of framing the definition: others are that all animals have sensation but not imagination, and that perceptions are true whereas imaginings (*φαντασίαι*) – for want of a better English word – are usually false (428a 5ff.). We may note in passing that whereas Plotinus regarded perception as unreliable and was less suspicious of imagination, which usually acted as an agent of some other power, Aristotle held perception to be reliable and thought that imagination was usually wrong: he was still influenced by its connection with the verb meaning 'to appear' with its strong connotation of appearing other than is the case (428b 2ff.).

Notwithstanding such differences one can see that Plotinus is working with the same concept as Aristotle, though he adapts it, exploiting a certain vagueness in some of Aristotle's statements, and extends the sphere of its operation. Both clearly and primarily associate imagination with the sense, both use it as a means of presenting material acquired by the senses to the reason, both hold that it is the basis of memory.

In its connection with sense-perception imagination presents the fewest problems. It is the power of soul by which we have available for consideration, or for subsequent use through memory, the information provided by the senses. We have seen that in Plotinus sense-percepts, as processed by imagination, were presented to the reason. Similarly in Aristotle reason deals with images which it has before it in the manner of perceptions (413a 14f.). The contexts are different, but since for both images derive from sensation, and are considered by reason, we may take it that the underlying doctrine is the same. There is, however, an important difference in the use of images. For Aristotle they are probably necessary for thought of any kind (413a 16f.), while for Plotinus the thinking of the true *nous*, the intuitive thinking which is superior to mere reasoning, can and does proceed without them, since *nous* is simply present among its objects. In fact the reason is informed of intuitive thought by means of images, and imagination makes the results of both kinds of thinking known to the rest of the soul (IV.3.30.5-11). When the imaginative faculty is disturbed then thinking proceeds without images (I.4.10.17-19).<sup>28</sup>

At the other end of Plotinus' scale, imagination makes the condition of the lower faculties, and that part of the body for which they are responsible, known to the higher soul (cf. IV.4.17.11ff., 20.17f.). In the case of desire the sensitive faculty perceives an image which conveys to it the condition of the lower soul (IV.4.20.12ff.). Thus we have a kind of sub-sensitive imagination in addition to that which operates between sensation and reason, and on one occasion Plotinus goes so far as to say that the former is imagination in the strict sense (VI.8.3. 10 ff.). Transmission of information about the body was of course a problem for Plotinus in a way that it was not for Aristotle, but it is possible that he constructed this

downward extension of the activities of the imaginative faculty on the basis of Aristotle's remarks in the *de Anima* and elsewhere about the role of imagination in desire – and other emotions – and movement: an animal can move in so far as it is equipped with appetite, and appetite does not exist without imagination (433b 27-30). So appetite and imagination are both involved in the causation of movement (433a 20): at *de Motu Animalium* 702a 17-19 Aristotle says that imagination prepares appetite. Further, Aristotle does, at *de Anima* 433b 31ff., raise the question of how the imperfect animals, that is those which have only the sense of touch, can have imagination, which normally presupposes all five senses, a question presented by the fact that these animals appear to have pleasure and pain. If so, they must have desire, which should imply imagination. Aristotle suggests that they perhaps have it in an indeterminate way (*ἀορίστως*). This last suggestion in particular could be a starting point for Plotinus' lower imagination, which he describes as 'unexamined' (*ἀνεπίκριτος*), in a context where the term may well imply that vagueness makes this kind of imagination unverifiable (III.6.4.18-23).<sup>29</sup>

Plotinus' most radical alteration of Aristotle's scheme of faculties comes when he considers the role of imagination as the basis of memory. Aristotle had little difficulty in coming to the conclusion that memory and imagination belong to the same faculty since all memories, even those of intelligible objects, require mental pictures (*de Mem.* 450a 11-14). Plotinus comes to the conclusion by a more difficult route, by way of considering from various points of view the possibility that each faculty could have those memories relevant to its peculiar activities. His difficulties arise mainly from two requirements, first the need to clarify the relation of memory and its faculty to the 'living being', the compound of body and the lower faculties, and then the apparent impossibility of having the activities of the higher part of the soul remembered by the lower, and *vice-versa*. Here the role of imagination as a transmitter and mediator between the different sections of the soul provides the solution.

But of course there are further difficulties, which I have discussed in detail elsewhere.<sup>30</sup> Before we consider them briefly

for their relevance to the present question, something should be said about the actual functioning of memory. Basically, in both Plotinus and Aristotle, the faculty retains images presented to it either from sensations below or reasonings above. But Plotinus, whose discussion in the treatise *On Sensation and Memory* (IV.6) is clearly based on Aristotle's account in the *de Memoria*, as Bréhier showed,<sup>31</sup> does not simply accept it as it stands.<sup>32</sup> He makes several alterations of detail, mainly with a view to removing materialistic, or at least apparently materialistic, features of Aristotle's account. In the first place he objects to Aristotle's talk of memory being the retention of some sort of imprint (*τύπος*) produced by perception or learning (*de Mem.* 450a 30-32). As Plotinus says at the start of his discussion (IV.6.1.1-5) it would make no sense to talk in these terms if one holds that perception does not involve any imprint, and the rest of the chapter argues once again that it does not. Plotinus was certainly not the first to be worried about the implications of the impression concept: Alexander had already expressed concern and said that the word was used only for lack of an appropriate one.<sup>33</sup> Plotinus says we must think rather of some sort of translation of the impression which affects the body: in an earlier treatise he speaks of 'something like indivisible thoughts' (IV.7.6.23).<sup>34</sup> For similar reasons Plotinus rejects Aristotle's explanation of the decline in old people's memory. Aristotle had accounted for it in terms of bodily changes, which he also took to be the cause of poor memory in the very young (*de Mem.* 450b 5-7). Plotinus substituted the suggestion that the psychic power involved declined, which enabled him to offer the same explanation for the fall-off in both memory and sense-perception (IV.6.3.51-5). As to the young, Plotinus argues, surely rightly, that they in fact remember better because they have as yet less material to remember (*ibid.* 21-4).

Let us return now to the problem of faculties. Here Plotinus innovates by splitting the faculty of imagination. This is the only way he feels able to explain how the higher soul which survives this life can, as it does, retain memories from it without being affected during life by the less elevated forms of memory which a person must have in the ordinary life of this world (IV.3.31-2). He thus requires a lower imaginative faculty to deal

with such lower memories and protect the higher memory, a need arising from his basic position that the soul, and particularly the upper soul, remains unaffected by its administration of the body with which it is, in theory, merely associated. Since, however, the soul as a whole must in this life have certain information available to it, the information stored by the lower soul is available to the higher. Moreover the break may, at least partly, be obscured if we think in terms of Plotinus' view of the lower soul as a product of the upper soul's attention to what lies below. Similarly the lower soul can become reassimilated to the higher—though if this were to happen happen definitively the activities of the lower would disappear. That would remove the very reason for the lower imaginative faculty's existence.

This radical innovation is by far the clearest case of the changes in Aristotelian psychology that arose from the needs of Plotinus' brand of Platonism, and in particular from the need to defend the soul's autonomy. Yet even this change may have been suggested by Aristotle's references, both in the *de Anima* and the *de Motu Animalium*, to two types of imagination, one rational and the other perceptual,<sup>35</sup> and also the hint in the *de Anima* of a lower kind of imagination which we have already mentioned.<sup>36</sup> For the purposes of this paper too much attention may have been focused on the similarities between Aristotle's views and Plotinus'. Perhaps as a corrective it would be as well to remember that there were a number of questions in which Aristotle was interested and to which Plotinus simply paid no attention. Such are the nature of sense objects and the sense organs, and the forms of sense-perception which had little relevance to Plotinus' higher interests. In the workings of the soul at the level of plants and animals Plotinus shows very little interest. At the risk of speaking in clichés one might suggest that the differences are to a large measure due to the fact that Aristotle was a scientist as well as a metaphysician, and simply wanted to know. If one wonders why Plotinus adopted and adapted Aristotle's psychology the answer would seem to be that — apart from certain historical factors — he wished to remain a good Platonist and yet felt obliged to give a more

satisfactory account of the soul's workings than Plato himself had found either possible or desirable.

### NOTES

1. For the purposes of this paper I have deliberately left aside the history of psychology between Aristotle and Plotinus. Much of this is still inadequately treated, and some will remain so for sheer lack of evidence. But it is of interest in considering Plotinus' psychology to see what he chose to use. Note: all unspecified references to Aristotle are to the *de Anima*.
2. *Vita Plotini* 14.4-7.

5. Ἄρ' οὖν οὕτω φατέον, ὅταν ψυχὴ σώματι παρῇ, παρεῖναι αὐτὴν ὡς τὸ πῦρ πάρεστι τῷ ἀέρι; καὶ γὰρ αὐτὸ καὶ τοῦτο παρὸν οὐ πάρεστι καὶ δι' ὅλου παρὸν οὐδενὶ μίγνυται καὶ ἑσθηκεῖ μὲν αὐτό, τὸ δὲ παραρρεῖ. It is clear from the context here, and also from what he says later when he refines the analogy from light to heat (IV.4.29 *init.*), that Plotinus is here thinking of fire primarily as light. One might wonder if even this Platonist statement is not itself suggested by Aristotle's description of light being the presence of fire in the transparent (418b 13-16).
6. On this see further my *Plotinus' Psychology. His doctrines of the embodied soul* (The Hague, 1971) 64-66.
7. Plotinus may well be deliberately improving on Plato since he offers this statement in IV.3 as an explanation of why the desiring part had been put in the liver.

8. Sometimes Plotinus thinks of these lower phases as belonging to the world-soul in its capacity of informing matter, rather than to the individual soul, cf. e.g. IV.9.3, 11ff. and *Plotinus' Psychology* 27-30.

## Iamblichus, Thrasyllus, and the Reading Order of the Platonic Dialogues

Michael Dunn

*The University of Texas at Austin*

The details of the well-known selection of twelve Platonic dialogues originally made by Iamblichus and later described by Proclus<sup>1</sup> and by the anonymous sixth-century *Prolegomena to Platonic Philosophy*<sup>2</sup> need not be expounded to modern Platonic scholars. Iamblichus' 'canon' codified certain preferences among the dialogues which were already apparent in Plotinus,<sup>3</sup> and after Iamblichus it became the standard format for the study of the Platonic dialogues in the Neoplatonic schools.<sup>4</sup> It was not, however, merely a random selection of what Iamblichus regarded as the most important Platonic dialogues: it also constituted a systematic and coherent course of reading in Plato. The student was to begin with the *First Alcibiades*, "because in it we come to know ourselves," and then was to ascend gradually through the different levels of virtues 'political' (the *Gorgias*), 'cathartic' (the *Phaedo*), and 'contemplative' (the *Cratylus*, *Theaetetus*, *Sophist*, *Statesman*,<sup>5</sup> *Phaedrus*, and *Symposium*)—ending at the *Philebus*, "because in it he [Plato] discusses the Good." Finally, the student was to approach the "perfect" dialogues, the *Timaeus* and the *Parmenides*, which summed up all the preceding ten.<sup>6</sup>

I will return to the implications of this reading course a little later in this paper. I would like to remind you first, however, that Iamblichus was by no means the first or even the last Platonist to propose a systematic reading order for the

Platonic dialogues. Proclus, for example, appears to have proposed a more comprehensive grouping which contained 32 dialogues;<sup>7</sup> but well before Iamblichus formed his canon, if we may rely on the evidence from the handbooks of Diogenes Laertius and the so-called Middle Platonists, the question of the order in which the dialogues should be read was often discussed. There is not enough time for me today even to mention all the proposals for a reading course that were made in the first and second centuries; but I would like to draw your attention in this paper to the most important of them all, both historically and as an interpretation of the Platonic dialogues, which has been strangely neglected and misunderstood by modern scholars. This is the division of the Platonic dialogues into nine 'tetralogies' which is associated in our ancient sources particularly<sup>8</sup> with the name of Thrasyllus, a Platonist, mathematician, and astrologer in the service of Tiberius, who died a few months before that emperor in A.D. 36.<sup>9</sup>

The tetralogies had a long history in Platonic studies: in the second century they were known and perhaps adopted by Theon of Smyrna,<sup>10</sup> while at approximately the same time they were being criticized and rejected by Albinus;<sup>11</sup> Diogenes Laertius devotes a lengthy discussion to them.<sup>12</sup> Among the Neoplatonists the tetralogies were superseded by Iamblichus' canon, but it is probable that they contributed to the formation of that canon,<sup>13</sup> and they were still thought worthy of refutation by the author of the sixth-century anonymous *Prolegomena*.<sup>14</sup> As the principle by which the manuscripts of Plato were organized, the tetralogies passed down to the Arabs, to the Renaissance, and to us; and we still find them used for the same purpose in modern editions of Plato.

In the time available today I intend to suggest three theses about the tetralogies:

I. That they constitute a coherent reading course in the Platonic dialogues, and were so regarded by the ancient Platonists.

II. That the main outlines of this reading course can be discovered.

III. That the tetralogies as a reading course are superior in important respects to the Iamblichan canon.

I. Modern scholarship has tended to emphasize the role of the nine tetralogies in the history of the transmission of the Platonic corpus: whether they are held to have originated in the early Academy or in the first century B.C.,<sup>15</sup> their chief significance has been taken to be that they were the framework of a great edition of Plato, and that they remained through the centuries "the great constant in the transmission of Plato."<sup>16</sup> This aspect of the tetralogies is certainly important, but is an historical accident, and one or two citations will, I hope, be sufficient to show that when ancient Platonists referred to the tetralogies they were not thinking of them primarily as editorial tools.

The clearest statement of the function of the tetralogies is made by Albinus in chapter IV of his *Introduction to the Dialogues of Plato*:

Since we have looked at the natural differentiation of the dialogues, and at their "characters", let us say next with what kind of dialogues we should begin reading Plato's philosophy. There have been different opinions. Some begin with the *Letters*, some with the *Theages*; and there are those who divide up the dialogues according to the principle of the tetralogy, and arrange the first tetralogy to contain the *Euthyphro*, *Apology*, *Crito*, and *Phaedo* . . . Of this opinion are Dercyllides and Thrasyllus.<sup>17</sup>

Albinus goes on to criticize the tetralogies and substitutes for them two proposals of his own, but in any case his meaning is plain: there were different opinions as to which dialogues should be read first by the beginning student, and Dercyllides and Thrasyllus were of the opinion that he should begin with the *Euthyphro*, *Apology*, *Crito*, and *Phaedo*. While it does not necessarily follow from Albinus' words that the rest of the tetralogies were also meant to be read in sequence, nothing in the passage excludes this possibility.

A second piece of evidence that the tetralogies were regarded as a reading order is a remark from Theon of Smyrna, a Platonist of the second century, preserved by the tenth-century Arab encyclopedist Ibn al-Nadim:

Theon said: "Plato arranged his writings for reading.

Each group consisting of four books, he called a tetralogy."<sup>18</sup>

Al-Nadim's epitome of Theon is abbreviated and sometimes confused, but if this passage is sound, Theon not only thought of the tetralogies as a reading order, but also believed that the tetralogical principle had the authority of Plato behind it; and since this claim was also made by Thrasyllus himself,<sup>19</sup> it provides some grounds for believing this citation from Theon to be authentic.

II. We must now examine the tetralogies themselves, and the ancient evidence about their contents, to see whether we can discover the principles behind this arrangement of the dialogues.

It will be helpful first to examine comparable organizational schemes which were applied to the works of two other ancient philosophers.

(1) Thrasyllus himself arranged the works of Democritus in tetralogies, probably on the model of the Platonic tetralogies.<sup>20</sup> An interesting thing about these Democritean tetralogies, however, is that Thrasyllus organized them into six larger groupings, under the headings 'ethical' (2 tetralogies), 'physical' (4 tetralogies), 'mathematical' (3 tetralogies), and so forth; in all, four of these six larger groupings are made up of two tetralogies each. In this case, therefore, Thrasyllus did not intend for the single tetralogies to stand by themselves, but that they should combine to form larger groups. We will see in a moment that he or someone else applied the same principle to the Platonic dialogues. It should be added, however, that the Democritean tetralogies do not seem to constitute a reading course.

(2) When Porphyry prepared his edition of the treatises of Plotinus, he selected as his basic group the ennead, or group of nine. Here again, we find the individual enneads combined to form larger groups, of which "the first contains three enneads; the second contains two; and the third contains one."<sup>21</sup> Furthermore, Porphyry's arrangement is clearly intended to be a reading order, beginning with the "lighter"<sup>22</sup> problems of moral behavior on earth (*Enn.* I), and ascending through Nature (*Enn.* II-III) to Soul (*Enn.* IV), Nous (*Enn.* V), and finally to the categories at the summit of Being, and to the One (*Enn.* VI).

Using the principles which we see to be at work in these other organizational schemes, I would like to suggest for your consideration the following analysis of the nine tetralogies.<sup>23</sup>

(1) There is an introductory group, consisting of the first tetralogy only and containing the four dialogues which deal with Socrates' trial and execution:

- I. *Euthyphro*, or On the Holy, peirastic
- Apology of Socrates*, ethical
- Crito*, or What Must Be Done, ethical
- Phaedo*, or On the Soul, ethical

Our sources,<sup>24</sup> which tell us little more about the tetralogies than their contents, do agree in singling out the first tetralogy from the others. Diogenes Laertius, moreover, preserves a valuable fact about Thrasyllus' attitude toward it:

He [sc. Thrasyllus] establishes a first tetralogy containing the common theme: for he wishes to give a paradigm of what the life of the philosopher would be like.<sup>25</sup>

Diogenes' words, unfortunately, leave it doubtful whether Thrasyllus meant that the theme of the life of the philosopher was confined solely to the first tetralogy, or whether this first tetralogy contained within it the common theme of the whole.<sup>26</sup> I am inclined to think that Thrasyllus meant the latter, and that the common theme of the whole reading course was the life of the philosopher in its different aspects, but I do not wish to affirm it as a fact, in the absence of more explicit evidence.<sup>27</sup> I believe we can say, however, that the first tetralogy stands apart from the rest as an introduction to the whole sequence.

(2) In defining the remaining groups of dialogues we cannot rely on specific evidence from the ancient sources; however, I believe we may make certain plausible conjectures on the basis of the contents of the dialogues themselves, and what is known of the interpretation of them by ancient Platonists.

I suggest, then, that we may see a second main grouping in the second and third tetralogies:

- II. *Cratylus*, or On the Correctness of Names, logical
- Theaetetus*, or On Knowledge, peirastic
- Sophist*, or On Being, logical

*Statesman*, or On Kingship, logical  
*Parmenides*, or On the Ideas, logical  
*Philebus*, or On Pleasure, ethical  
*Symposium*, or On the Good, ethical  
*Phaedrus*, or On Love, ethical

It will be observed, first of all, that all of the dialogues which had been characterized by the Platonic tradition as "logical" are contained within this group. Just as later Platonists would preface the study of Plato with Aristotle's logic, so in Thrasyllus' reading course the student who is fresh from reading about the trial and death of Socrates will begin his study of philosophy with a group of dialogues which deal with knowledge and the dialectical means of arriving at it. He begins with the consideration of language, in the *Cratylus*, then proceeds to the inquiry into knowledge, the *Theaetetus*. Plato himself could then be taken to indicate, by the repetition of characters and by many cross-references, that the *Sophist* and the *Statesman* should follow the *Theaetetus*.

The precise function of the next four dialogues is a little difficult to determine, and the *Parmenides* provides a good illustration of the problem we face. We may fairly safely assume that it was not yet given the characteristically 'theological' interpretation familiar to us from Plotinus and his successors. Yet Proclus knew of at least two other interpretations of the *Parmenides* which were current among the earlier commentators: one along the lines of its secondary title, *On the Ideas*, and one which treated it as a "logical exercise".<sup>28</sup> The latter interpretation may be reflected in the writings of Albinus, who refers to the *Parmenides* as a place where one may find numerous examples of the hypothetical syllogism,<sup>29</sup> or an outline of the ten Aristotelian categories.<sup>30</sup> Galen, similarly, speaks of the "exercise" (*gymnasia*) of the method of diaeresis in the *Sophist* and *Statesman*, and finds it "most clearly and most perfectly" demonstrated in the *Philebus* and *Phaedrus*.<sup>31</sup> It is certainly possible that, at the very beginning of a reading course in Plato, the beginner might be encouraged to look for this "gymnastic" element in the dialogues, in order to learn logical or dialectical methods.

On the other hand, this severely pragmatic interpretation of these dialogues as mere exercises in method is not what we would expect from the Pythagorean and astrologer Thrasyllus. Should we not also see in this group of dialogues a gradual ascent from the subject of language in the *Cratylus* to a culminating vision of the Good in the *Symposium* and *Phaedrus*—a vision, of course, only attainable through dialectic? In this case, the last four dialogues would not only be exercises in logic but also descriptions of the higher kinds of knowledge.

If the dialogues of this group were understood as an ascending order culminating in a vision of the Good, then we probably need look no further for the origins of Iamblichus' canon. A glance at the two lists will show how strikingly similar they are:

*Thrasyllus' tetralogies*

Euthyphro  
 Apology  
 Crito  
 Phaedo

1. Cratylus
2. Theaetetus
3. Sophist
4. Politicus
5. Parmenides
6. Philebus
7. Symposium
8. Phaedrus

*Iamblichus' canon*<sup>32</sup>

Alcibiades I  
 Gorgias  
 Phaedo  
 1. Cratylus

2. Theaetetus
3. Sophist
4. Politicus
8. Phaedrus
7. Symposium
6. Philebus
- Timaeus
5. Parmenides

(3) The third group of dialogues, like the second, contains two tetralogies:

- III. *Alcibiades I*, or On the Nature of Man, maieutic
- Alcibiades II*, or On Prayer, maieutic
- Hipparchus*, or Lover of Profit, ethical
- Anterastae*, or On Philosophy, ethical
- Theages*, or On Philosophy, maieutic
- Charmides*, or On Temperance, peirastic
- Laches*, or On Courage, maieutic
- Lysis*, or On Friendship, maieutic

In the same way that the "logical" dialogues were all contained in the second group, Thrasyllus or the inventor of the tetralogies included all the "maieutic" dialogues within this third group. The term "maieutic", which we might render clumsily as "obstetric", derives from the well-known passage in the *Theaetetus* (149a-151e) in which Socrates compares himself to a midwife, and his characteristic activity to midwifery. In the traditional characterizations of the dialogues,<sup>33</sup> therefore, "maieutic" was the term applied to dialogues in which Socrates is seen in this activity, and it is this "midwifery", rather than any formal philosophical theme, which forms the connecting link between the dialogues of the third group. Another theme, closely related to it, is that of love.<sup>34</sup> Often Socrates pretends to be in love himself, as in the *First Alcibiades*, and the *Charmides*; at other times he converses with lovers, as in the *Anterastae* and *Lysis*; in the *Hipparchus*, in addition to playing on the word "lover of gain", Socrates tells the story of the famous lovers Harmodius and Aristogeiton. The themes of midwifery and love, finally, are seldom separated in these dialogues from the question "who is the best educator of the young?", which is discussed on its own in the *Theages* and *Laches*.

(4) A fourth group is easily recognized in the next two tetralogies:

- IV. *Euthydemus*, or the Lover of Contest, anatreptic
- Protagoras*, or On Rhetoric, anatreptic
- Meno*, or On Virtue, peirastic
- Hippias I*, or On the Beautiful, anatreptic
- Hippias II*, or On Falsehood, anatreptic
- Ion*, or On the Iliad, peirastic
- Menexenus*, or Funeral Oration, ethical

This fourth group, like the preceding two, contains a concentration of dialogues to which tradition had assigned the same philosophical 'character'. That is, in this group are found all of the 'anatreptic' dialogues (dialogues in which the opponent is "overthrown"), together with the single 'endeictic' or 'exhibitory' dialogue; and according to Diogenes Laertius III.49 these two groups together form the class of 'agonistic' dialogues, or dialogues of contest.

Wilamowitz observed how useful the *Euthydemus* is as a means of transition from the third sequence to this one:<sup>35</sup> the question it raises, again, is "who is to educate the youth in virtue?" In this fourth sequence of dialogues, however, particular attention is paid to the philosopher's rivals as educators, the sophists. Ion is not technically a sophist, of course, but is included in this group as a false teacher. And finally, the *Menexenus* seems to have been placed at the end of this group for two reasons: first, Thrasyllus or the author of the tetralogies in all likelihood took the funeral oration seriously, as an example of sound oratory which could be contrasted to the false oratory of the sophists; secondly, the political theme of the oration would have seemed an excellent transition or introduction to the political dialogues of the last two tetralogies.

Before proceeding, however, I would like to point out briefly that, if I have described the third and fourth groups of dialogues correctly, then *concepts* and *doctrines* would seem to have played less important a part in Thrasyllus' reading of these sixteen dialogues than did the *personae*, their relationships, and what they do or experience. It may also be recalled that Albinus rejected at least the first of Dercyllides' and Thrasyllus' tetralogies on the grounds that they intended to apply an ordering to "personae and the circumstances of their lives."<sup>36</sup> A modern reader, however, might well approve of this emphasis on the *personae* in the dialogues of the third and fourth groups. The characters of the *Laches*, for example, learn nothing positive about the abstract concept of courage, but they do find in the person of Socrates an answer to their original question, "who is to educate the young in virtue?" In the *Charmides*, again, every abstract definition of temperance is called into doubt, but the dialogue ends with the young interlocutor placing himself under the tutelage of Socrates, because Charmides has come to realize that he does not know if he is temperate or not. In both cases the modern reader might be inclined to emphasize the confusion or "aporia" of the interlocutor, while Thrasyllus, perhaps, more accustomed to emphasize Socrates' midwifery, would point rather to the saving presence of the philosopher; but both alike would locate the

significance of these dialogues in what happens to the characters.

That I am not merely reading modern preoccupations into these dialogues can be shown from a passage in Albinus' *Eisagoge*, in which he declares that dialogues of an "expository" character aim at *things* or *topics*, while those of an "inquiring" type aim at *personae*.<sup>37</sup> Now, of the sixteen dialogues contained in the third and fourth groups, thirteen are characterized as maieutic, peirastic, endeictic, or anatreptic, which are the four lowest divisions, according to Diogenes Laertius III, 49, of the "inquiring" type of dialogue.

(5) The political theme of the fifth group of dialogues, which is made up of the last two tetralogies, is so evident that it hardly needs comment:

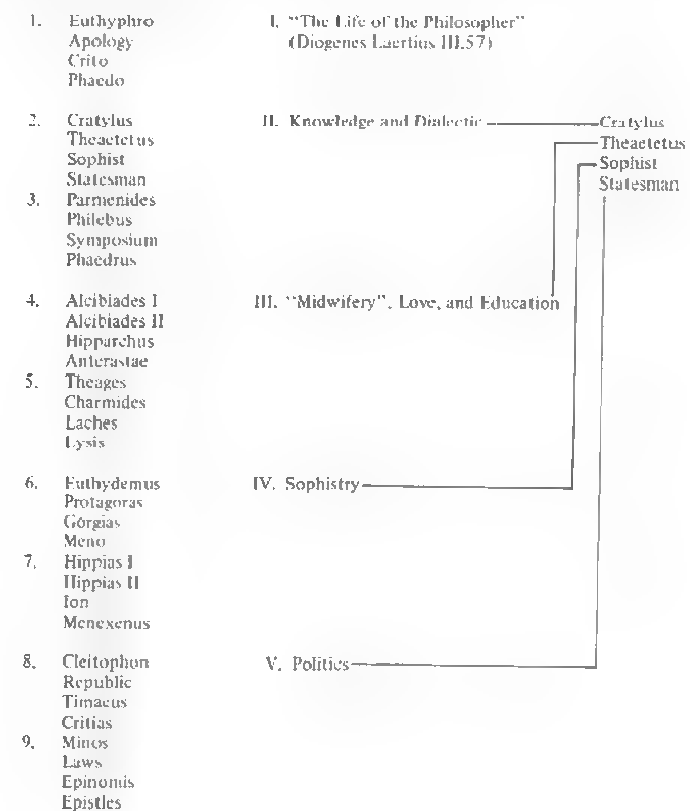

- V. *Cleitophon*, or Protrepticus, ethical
- Republic*, or On the Just, political
- Timaeus*, or On Nature, physical
- Critias*, or Atlanticus, ethical
- Minos*, or On Law, political
- Laws*, or On Legislation, political
- Epinomis*, or Nocturnal Assembly, or Philosopher, political
- Epistles*, ethical

The *Timaeus*, a 'physical' dialogue, is only apparently an anomaly among the political dialogues, since of course Plato himself in the prologue to the *Timaeus* makes it a continuation of the *Republic* and the cosmological background to the history contained in the *Critias*. The *Cleitophon* must have seemed the natural preface to the *Republic*, since Cleitophon represents himself as a pupil both of Socrates and of Thrasymachus, discusses justice with Socrates, and appears briefly as an interlocutor in the *Republic* (1. 328b and 340a-b). The inclusion of the *Minos*, *Laws*, *Epinomis* and *Epistles* among the 'political' dialogues hardly needs any explanation.

From Diogenes Laertius we already know that the "common theme" of the first tetralogy was the life of the philosopher. From the survey we have just made I think we can now take the common theme of the second group of dialogues to be knowledge and dialectic; that of the third to be

midwifery, love, and education; that of the fourth, sophistry; and that of the fifth, politics. In emphasizing these aspects of the Platonic dialogues the author of the tetralogies was certainly suggesting no categories that would not occur to any modern reader: they really are primary elements in Plato's dialogues, perhaps *the* primary elements.

There is a coincidence, however, to which I would like to draw your attention, because it suggests that Thrasyllus or whoever invented the tetralogies may have had a definite model before him for these divisions of the reading sequence. The coincidence is in the apparent correspondence of the four dialogues of the second tetralogy with the last four sequences of the reading order. The correspondence can be illustrated most clearly with a diagram:

In other words, the *Cratylus* ("On the Rightness of Names", "Logical"), might be compared to the whole group of dialogues in which knowledge and dialectic are the main themes. The *Theaetetus*, which follows it, contains Socrates' comparison of his conversations with the young to midwifery, or *maieutike*, the comparison which gave the name "maieutic" to more than half of the dialogues of the second main group. The third dialogue of the second tetralogy, the *Sophist*, defines the character to which the philosopher is opposed in the dialogues of the fourth main group. Finally, the definition of the noble statesman in the *Statesman* corresponds to the concern with the philosopher and politics in the last main group. It may well be that, after establishing the first tetralogy as the introduction to Plato's philosophy, Thrasyllus or the inventor of the tetralogies then deliberately employed the second tetralogy as the Platonic model and authority for the four main divisions of the reading order.

III. I said at the beginning of this paper that I would suggest the thesis that the nine tetralogies are in several respects superior to Iamblichus' canon as a reading course in Plato's dialogues. I hope that the reasons for this claim have become a little clearer as I have tried to bring to light what I believe to be the principle themes around which the tetralogies are organized.

I acknowledge at the outset that the tetralogies fail in several fundamental ways as a tool for the understanding of Plato. These failures derive from an important error, which is the impulse to synthesize the different dialogues without also keeping in mind their specific differences. Plato never intended that all the dialogues should form a coherent sequence, much less a complete philosophical education; consequently, any attempt to establish such a sequence necessarily has something fraudulent about it, and is obtained at the cost of emphasizing similarities between dialogues while sacrificing what is unique and different in every dialogue: the *Symposium*, for example, becomes a few paragraphs of Diotima's speech, in order to be the culmination of the "dialectical" dialogues.

This impulse to synthesize, however, was the very spirit of the age, and no commentator on Plato living at the time could expect to escape it. Once we grant Thrasyllus, or the inventor of

the tetralogies, this impulse, it becomes possible to argue that he produced a relatively successful reading course, one certainly superior to Iamblichus' canon. In Iamblichus the synthesizing went too far: not only did he "reduce"<sup>38</sup> all the Platonic dialogues to his twelve selected ones, but he also "reduced" these twelve to the *Timaeus* and *Parmenides*. When Professor Hathaway says of the Neoplatonists that "we cannot suppress the suspicion that they believed that every dialogue was about the same thing,"<sup>39</sup> he is pointing out a very real tendency in their exegesis. A continuous movement in this direction can be traced in the history of the philosophical "characters" or "types" of the dialogues. There were originally eight of them; in Thrasyllus' tetralogies only four are significant, the logical, maieutic, agonistic (combining the anatreptic and endeictic), and political; eventually Iamblichus had only two, the physical and the theological.<sup>40</sup>

The difference between Thrasyllus' four dialogue-types and those of Iamblichus, however, goes beyond the difference in number. Thrasyllus' groups of dialogues express what really are pervasive themes in Plato's dialogues: knowledge and dialectic; midwifery, love, and education; sophistry; and politics. In other words, Thrasyllus' categories come out of the dialogues themselves. Iamblichus' categories of "physical" and "theological", on the contrary, and his association of the dialogues with different levels of virtues, are arbitrary categories forced on the dialogues to make them conform to the dogmatic and theological Plato of Neoplatonism.

If I am right that the dialogues of Thrasyllus' second group describe an ascent to the Good, then Thrasyllus' Plato, too, is theological, but unlike Iamblichus' Plato, he is not only that. In Thrasyllus' tetralogies the ascent to the Good occurs early in the reading course, and it is not the culminating event it seems to be for Iamblichus, who borrowed this part of the tetralogies and threw away the rest. The reader of the tetralogies, after ascending out of the Cave with Plato the theologian in the *Symposium* and the *Phaedrus*, descends back into the Cave again immediately with Socrates the midwife. Prof. Hathaway has summed up Iamblichus' interpretation of the Platonic dialogues by saying it leaves out both Socrates himself and the

characteristically Socratic sense of *aporia*.<sup>41</sup> Thrasyllus' tetralogies do at least give us Socrates—not, I think, a genuinely aporetic one, wise only in the knowledge that he knows nothing, but a Socrates nevertheless, one who has already achieved wisdom, but who will be midwife, lover, and teacher to other human beings.

Finally, it can be said that the tetralogies leave us with a truer picture of the importance of political virtue in Plato's thought. In Iamblichus' canon political virtue is the least of the virtues to be learned from the study of Plato. The reader concerns himself with it just after reading the introductory *Alcibiades I*, and then moves on to higher virtues. In the tetralogies, on the contrary, the political dialogues have equal standing with the logical or maieutic or agonistic groups; they are in no way subordinated to the ascent to the Good contained within the logical group. In fact, the reader comes to Plato's political treatises last of all, after much experience of Plato; far from being simply an intermediate stage, the political dialogues in Thrasyllus' reading order actually conclude and perfect the reader's philosophical education.<sup>42</sup>

## NOTES

1. Proclus, *Commentary on Alcibiades I*, ed. Westerink, 11, 11-17.
2. *Anonymous Prolegomena to Platonic Philosophy*, ed. Westerink, 29, 12-34.
3. R. F. Hathaway, "The Neoplatonic Interpretation of Plato: Remarks on its Decisive Characteristics", *Journal of the History of Philosophy* 7 (1969) 20-22.
4. *Anon. Prol.* 26, 17-18. *τούτων* [sc. *τῶν διαλόγων*] δὲ ἄξιον ἔστω τὴν τάξιν ζητῆσαι, διότι καὶ τούτου, ἡξίωσαν πάντες πράττεσθαι.
5. The text of the anonymous *Prolegomena* appears to have a gap at 26, 31-32, *εἴτα ἐρχόμεθα μετὰ τούτους εἰς τὸν (. . .) περὶ φυσικῶν διδάσκοντα* and mentions only ten dialogues in all, including the *Timaeus* and *Parmenides*. Proclus,

however, definitely states that there were twelve in the canon (*Comm. on Alec. I*, 11, 15-17). Westerink, xxxvii-xxxix, suggest excellent reasons for inserting the *Sophist* and *Statesman* in the supposed gap, and this has been accepted by A. J. Festugière, "L'ordre de lecture des dialogues de Platon aux Ve/VIe siècles", *Mus. Helv.* 26 (1969) 284-85; but Hathaway, p. 23, n. 23, still expresses doubt.

6. *Anon. Prol.* 26, 14-16 and 18-34. The anonymous goes on to add that "some think that one should 'do' the *Laws* and the *Republic* also, καὶ τοὺς Νόμους καὶ τὰς πολιτείας πράττειν ἁξιοῦσί τινες."
7. *Anon. Prol.* 26, 5-13 mentions this grouping, but passes it over as for brevity's sake and because it was "not particularly useful" (*μὴ πᾶν τι χρησιμεύουσαν*).
8. Only Thrasyllus is mentioned by Diogenes Laertius (III, 56-62), who cites him directly. But Albinus (*Eisagoge* IV, 12-13, ed. Hermann) also speaks of Dercyllides (*ταύτης τῆς δόξης εἰσὶ Δερκυλλίδης καὶ Θράβυλλος*.) Dercyllides is otherwise known from a few citations in Theon, Proclus, and Simplicius, but nothing in these citations adds to our knowledge of his use of the tetralogies, or even enables us to declare with any confidence when he lived. The common assertion that he preceded Thrasyllus in framing the tetralogies depends for evidence, apart from the inconclusive order of the names as Albinus gives them, upon a sentence in Varro's *De Lingua Latina* (VII.37), in which Varro apparently refers to the myth of the *Phaedo* with the words, "Plato in IIII", which seems to mean "in the fourth (dialogue)". Between 47-45 B.C., then, Varro may have known of some listing or edition of the dialogues in which the *Phaedo* was fourth, as it is in the tetralogies; but Thrasyllus lived until A.D. 36, and cannot have been Varro's authority. Since Dercyllides is the only other name to which we can definitely attach such an arrangement in this period, it is plausible to think that Varro was referring to the tetralogies of Dercyllides.
9. *Schol. Vet. in Juvenalem Sat.* VI, 576: "Thrasylus [sic] multarum artium scientiam professus postremo se dedit

Platonicae sectae ac deinde mathesi, in qua praecipue viguit apud Tiberium, cum quo sub honore eiusdem artis (in) familiaritate vixit..." By the time of Tacitus there were legends about his skill in predicting the future (*Ann.* VI, 21); according to Dio Cassius (*Hist. Rom.* LVIII, 27.1) Thrasyllus accurately foretold the day and hour of his own death. But he seems also to have had a reputation for less arcane knowledge: in the third century Longinus mentions his interpretations of the "Pythagorean and Platonist first principles" together with those of Moderatus, Cronius, and Numenius (Longinus *apud* Porphyry, *Life of Plotinus*, 20, 71-76).

Friedrich Nietzsche conceived a remarkable fascination with "die düstre faustische Persönlichkeit Thrasylls" (Friedrich Nietzsche, *Werke*, 3. Band, ed. H. J. Mette and K. Schlechta, München 1935, p. 349). Inquiring how the practitioner of so feeble a science as astrology could escape the suspicions of a Tiberius, Nietzsche concluded: "Es müssen da persönliche Eigenschaften gewesen sein, etwa eine strenge asketische Haltung, ein Auge voller Trauer, eine würdevolle Gestalt, tiefe Stimme und dergl. was Tiberius in dem Glauben bestärkte, er habe es mit einem ungewöhnlichen überlegen(en) Menschenkind zu thun" (*Werke*, 3. Band, p. 366).

10. Theon's work has perished in the original, but was known to the Arabs. The tenth-century encyclopedist Ibn al-Nadīm says under the heading "Theon": "He was a zealous partisan of Plato. Among his books there was *Sequence of Reading Plato's Books and the Titles of his Compositions*" (Ibn al-Nadīm, *The Fihrist*, tr. Bayard Dodge, N. Y. 1970, p. 614). Al-Nadīm ascribes brief and unfortunately confused statements to Theon which probably derive from this work (in which we may recognize a standard introduction to the Platonic dialogues, comparable to Albinus' *Eisagoge*, Diogenes Laertius III. 48-51 and 56-66, and the *Anon. Prol.* 13-27). One such statement shows that Theon discussed the tetralogies: "Theon said: 'Plato arranged his writings for reading. Each group, consisting of four books, he [Plato] called a tetralogy'" (*Fihrist*, pp. 593-4, Dodge).

Al-Nadīm also gives a list of dialogues on the authority of Theon which do not reproduce the tetralogies, and which I believe to be based on the traditional philosophical characters, or 'types' of the Platonic dialogues; but J. Lippert and K. von Fritz are probably correct to assume that Theon did not intend this second order as a substitution for the tetralogies (see von Fritz, "Theon" *RE* A10, col 2069). Another Arab author, Ibn Abi Usaybiyah, reproduces a recognizable version of the tetralogical ordering which may also derive from Theon; however, he does not mention Theon by name (*Uyun al-Anba*, ed. A. Müller, Königsberg 1884, pp. 53-54). Miss Tamar Frank of Yale University has very kindly supplied me with English translations of the relevant Arabic texts.

11. Albinus, *Eisagoge* IV (p. 149, 1-17 Hermann).
12. Diogenes Laertius III. 56-61.
13. See below, p. 65.
14. *Anon. Prol.* 24, 20; 25, 29. Since so much of the material treated by the anonymous author under this rubric had also been dealt with by Proclus (Westerink, xxxii-xxxiii), and since the anonymous introduces certain objections made by Proclus into his discussion of the tetralogies, it is likely that Proclus, too, discussed the tetralogical ordering. It is entirely possible, in fact, that the grouping of 32 dialogues which the anonymous ascribes to Proclus may simply have been the traditional nine tetralogies, less the four dialogues which Proclus omitted for reasons of his own.
15. Two theories are held about the date of origin of the tetralogies: (1) that they were drawn up by Plato's successors in the Academy at a very early date, or at least the earliest date consistent with the presence of the spurious dialogues in the corpus. The supporters of this theory have included Wilamowitz, *Platon* II (Berlin 1920), p. 324; Bickel, *Rhein. Mus.* 92 (1943-44), pp. 94-96 and 97-159; Erbse, *Geschichte der Textüberlieferung* I (Zürich 1961), pp. 219-221; and recently Pfeiffer, *History of Classical Scholarship* (Oxford 1968), pp. 196-197.

(2) that they were drawn up in the first century B.C., either by Dercyllides or by some near contemporary of his and of Varro's (see note 8, above). This view was first proposed by K. F. Hermann, *De Thrasyllō grammatico et mathematico* (Göttingen 1853, p. 13, who believed, however, that Dercyllides was responsible only for the first tetralogy, Thrasyllus for the rest. The case for the date in the first century was stated in its most cogent form by Usener, *Gött. Nachr.* 1892, Nr. 2, pp. 25-50; Nr. 6, pp. 181-215 (= *Kleine Schriften* III, pp. 104-162). See also Alline, *Histoire du texte de Platon* (Paris, 1915), p. 113; Susemihl, *Philologus* 54 (1895), p. 573; and Chroust *Hermes* 93 (1965), pp. 34-46.

For reasons too complicated to discuss here, I think (2) the more likely explanation.

16. "Die grosse Konstante der Platonüberlieferung," E. Bickel, *Rhein. Mus.* 92 (1943-44), pp. 100-101.
17. Albinus, *Eisagoge* IV (P. 149, 1-13 Hermann): ἐπεὶ οὖν θεωρήκαμεν τὴν διαφορὰν αὐτῶν ὡς πέφυκε γίγνεσθαι καὶ τοὺς χαρακτήρας, ἐπὶ τούτοις λέγωμεν, ἀπὸ ποίων διαλόγων δεῖ ἀρχομένους ἐντυγχάνειν τῷ Πλάτωνος λόγῳ. διάφοροι γὰρ δόξαι γεγόνασιν· οἱ μὲν ἀπὸ τῶν Ἐπιστολῶν ἀρχονται, οἱ δὲ ἀπὸ τοῦ Θεάγου· εἰσὶ δὲ οἱ κατὰ τετραλογίαν διελόντες αὐτοὺς καὶ τάττουσι πρῶτην τετραλογίαν περιέχουσαν τὸν Εὐθύφρονα καὶ τὴν Ἀπολογίαν καὶ τὸν Κρίτωνα καὶ τὸν Φαῖδωνα . . . ταύτης τῆς δόξης εἰσὶ Δερκυλλίδης καὶ Θράσυλλος.
18. Al-Nadīm, *The Fihrist*, pp. 593-594 Dodge. Ibn al-Qifti (A.D. 1172-1248) reproduces the same statement, but appears simply to be copying Nadīm Ta'rikh al-Hukama', ed. J. Lippert, Leipzig 1903, pp. 17-18).
19. Diogenes Laertius III.36, 20-25: Θράσυλλος δὲ φησι καὶ κατὰ τὴν τραγικὴν τετραλογίαν ἐκδοῦναι αὐτὸν [sc. Plato] τοὺς διαλόγους (cf. *Anon. Prol.* 24, 20). This statement does not necessarily mean that Thrasyllus thought his own tetralogies were anything more than an approximation of the original ones.

Theon's extant work *Mathematics Useful for the Reading of Plato* cites Thrasyllus frequently, which sug-

gests the possibility that Theon's lost work on the dialogues, called by Nadīm *The Sequence of Reading Plato's Books and the Titles of his Compositions*, may also go back to Thrasyllus.

20. Diogenes Laertius IX. 45-49.
21. Porphyry, *Life of Plotinus*, 26.
22. Porphyry, *Life of Plotinus*, 24: ἐκάστη δὲ ἐννεάδι τὰ οἰκεία φέρων συναφόρησα δούς καὶ τάξω πρῶτην τοῖς ἐλαφροτέροις προβλήμασιν.
23. Although modern scholars have not noticed the significance of the tetralogies as a reading course, the attempt to find an explanation for the order of the dialogues within the tetralogies is by no means a new one: see H. Alline, *Histoire du texte de Platon* (Paris 1915), pp. 115-117; and U. von Wilamowitz, *Platon* II (Berlin 1920), pp. 324-325. Both of these discussions, which are too long to summarize here, contain many valuable observations; but both men were concerned primarily with the mechanical process of getting from Plato's own "trilogies" to the tetralogies, and so tend to explain the placing of individual dialogues in terms of filling "gaps". I wish to claim, on the contrary, that the dialogues were deliberately arranged to form a systematic and coherent progression from beginning to end.
24. Primarily Diogenes Laertius III. 56-61; Albinus *Eisagoge* IV, 1-14; and the *Anonymous Prolegomena* 24.20-25.24.
25. Diogenes Laertius III. 57, 5-6: πρῶτην μὲν οὖν τετραλογίαν τίθῃσι τὴν κοινὴν ὑπόθεσιν ἔχουσαν· παραδείξει γὰρ βούλεται ὁποῖος ἂν εἴη ὁ τοῦ φιλοσόφου βίος.
26. There are at least two ways of construing the word τὴν in the first sentence:  
(1) τὴν goes with ἔχουσαν, both referring back to τετραλογίαν. It might be inferred from this, however, that the first tetralogy is the only one which has a common subject, and that the rest do not, while in fact Thrasyllus and the inventor of the tetralogies must certainly have ascribed common subjects to at least the second and the eighth tetralogies, which are at least partially suggested by Plato himself.

(2) τὴν goes with κωμὴν ὑπόθεσιν, i.e., "he establishes a first tetralogy having the common subject; for he wishes to give a paradigm of what the philosopher's life is like." To speak of the first tetralogy containing the common subject would appear to refer this common subject not only to the first tetralogy, but to the entire series, so that we might paraphrase it, "Thrasyllos establishes a first tetralogy having (within itself) the common subject (of the whole reading sequence)". This would be a very significant addition to our knowledge of the tetralogies if it is what Diogenes meant. It should be noted that this way of taking the sentence derives some support from a similar turn of phrase in Albinus' description of the same tetralogy (*Eis.* IV, p. 149, 6-7 Hermann): τὰττουσι πρῶτην τετραλογία περιέχουσιν τὸν Εὐθύφρονα κτλ. If τὴν went with ἔχουσιν in Diogenes, we might expect a similar τὴν before περιέχουσιν in Albinus; instead, we find τὸν Εὐθύφρονα used in the same way as τὴν κωμὴν ὑπόθεσιν.

27. Albinus' account of the first tetralogy is no help, since although it roughly corresponds to that found in Diogenes, it diverges in a significant detail. After mentioning that the first tetralogy contains the *Euthyphro*, *Apology*, *Crito*, and *Phaedo*, Albinus goes on to give the reasons for their inclusion together:

... the *Euthyphro*, since in it the trial is announced to Socrates; the *Apology*, since it was necessary for him to give a defence; next the *Crito*, because of the homily in the prison; then the *Phaedo*, since in it Socrates reaches the end of his life. Of this opinion are Dercyllides and Thrasyllos; but they seem to me to have intended to apply an order to personae and to circumstances of lives, which is perhaps useful for other purposes, but not for what we want now. . . .

Albinus refers the first tetralogy to specific personae and what happen to them, that is, to Socrates and his trial. Diogenes, on the other hand, speaks of these personae and events as paradigmatic, referring not to Socrates but to "the philosopher" in general. Since Albinus clearly states

his interpretation of the first tetralogy as a personal opinion (δοκοῦσι μοι) "they seem to me . . ." it is likely that if either of these two sources preserves Thrasyllos' own explanation, it is Diogenes rather than Albinus.

28. Proclus, *Commentary on the Parmenides*, p. 630, 37ff. Cousin: εἰσὶ δέ τινες καὶ γεγονόσιν τῶν ἔμπροσθεν, οἳ τὸν τοῦ διαλόγου τοῦδε σκοπὸν εἰς λογικὴν ἀνέπεμψαν γυμνασίαν, τὴν μὲν ἐπιγραφὴν καίτοι παμπάλαιον οὔσαν τὴν Περί τῶν ἰδεῶν ἀτιμάντες . . .
29. Albinus, *Didaskalikos* VI. (p. 159, 4-7): τοὺς δὲ ὑποθετικούς ἐν πολλοῖς βιβλίοις εὐρήσομεν ἐρωτωμένους ὑπ' αὐτοῦ, μάλιστα δ' ἐν τῷ Παρμενίδῃ τοιούτους εὐροίμεν ἀν λόγους.
30. *Did.* VI. (p. 159, 34-35): καὶ μὴν τὰς δέκα κατηγορίας ἐν τε τῷ Παρμενίδῃ καὶ ἐν ἄλλοις ὑπέδειξε . . . . Galen, *De Placitis Hippocratis et Platonis*, p. 767, 10ff. Müller speaking of ἡ διαιρετικὴ μέθοδος: ἥς τὴν μὲν γυμνασίαν ὁ Πλάτων ἐν Σοφιστῇ καὶ Πολιτικῷ πεποιήται, τὴν δὲ ἐξ αὐτῆς χρεῖαν ἐπέδειξεν οὐκ ἐν τούτοις μόνον, ἀλλὰ σαφέστατα μὲν ἅμα καὶ τελεώτατα κατὰ τε Φίληβον καὶ Φαῖδρον.
31. Galen, *De Placitis Hippocratis et Platonis*, p. 767, 10ff. Müller speaking of ἡ διαιρετικὴ μέθοδος: ἥς τὴν μὲν γυμνασίαν ὁ Πλάτων ἐν Σοφιστῇ καὶ Πολιτικῷ πεποιήται, τὴν δὲ ἐξ αὐτῆς χρεῖαν ἐπέδειξεν οὐκ ἐν τούτοις μόνον, ἀλλὰ σαφέστατα μὲν ἅμα καὶ τελεώτατα κατὰ τε Φίληβον καὶ Φαῖδρον.
32. As reconstructed by Westerink, xl. — It is interesting to compare the recent study by E. Wyller, *Der späte Platon* (Hamburg 1970), in which it is argued that Plato describes an ascent from the Cave in the *Cratylus* and the *Theaetetus*; then describes the synthesis achieved once outside the Cave, in the *Sophist*, *Statesman*, and *Parmenides*; and finally describes the descent back, in the *Philebus*, *Phaedrus*, *Timaeus*, *Laws*, *Epinomis*.
33. See Diogenes Laertius III.49.
34. H. Alline, *Histoire du texte de Platon*, p. 116, emphasizes the theme of love in these dialogues. Counting the *Symposium* and *Phaedrus* among them (mistakenly, I

believe), he speaks of them as "un groupe de dix dialogues érotiques où Socrate converse avec des jeunes gens ou à propos de jeunes gens que généralement il est censé d'aimer."

35. Wilamowitz, *Platon* II, p. 325: "Von der Sechsten [Tetralogie], die die grossen Kämpfe mit den Sophisten enthält, wies der Euthydem durch dem Protreptikos des Kleinias auf die Fünfte zurück. — Both Alline and Wilamowitz recognized a grouping of dialogues on the sophists, but Wilamowitz excluded the *Menexenus* from it, and Alline the *Ion* and the *Menexenus*.
36. Albinus, *Eisagoge* IV (p. 149, 12-14 Hermann): ταύτης τῆς δόξης εἰσὶ Δερκυλλίδης καὶ Θράσυλλος, δοκοῦσι δέ μοι προσώποις καὶ βίων περιστάσεων ἡθεληκέναι τάξιν ἐπιθεῖναι.
37. Albinus, *Eisagoge* III (p. 148, 28-29 Hermann): . . . ὁ μὲν ὑφηγητικός τῶν πραγμάτων στοχάζεται, ὁ δὲ ζητητικός τῶν προσώπων.
38. *Anon. Prol.* 26, 12-16: λέγομεν δὲ ὁ ὁ θεῖος Ἰάμβλιχος ἐποίησεν. αὐτὸς τοῦν πάντας εἰς ἑξήκοντα διαλόγους, καὶ τούτων τοὺς μὲν φυσικοὺς ἔλεγεν, τοὺς δὲ Θεολογικοὺς· πάλιν δὲ τοὺς δώδεκα συνήρει εἰς δύο, εἰς τε τὸν Τίμαιον καὶ τὸν Παρμενίδην, ὧν τὸν μὲν Τίμαιον ἐπὶ πᾶσι τοῖς φυσικοῖς, τὸν δὲ παρμενίδην τοῖς Θεολογικοῖς. Westerink translates διήρει and συνήρει as "reduced". Hathaway, p. 23 n. 24, suggests "abridged".
39. Hathaway, p. 25.
40. *Anon. Prol.* 26, 14.
41. Hathaway, p. 26.
42. This paper, written in 1973, was based upon an unfinished chapter of my doctoral dissertation, and the argument of the first two sections of this paper was subsequently enlarged and improved by a number of revisions. The changes, however, have been changes of detail, and my interpretation of the tetralogies remains essentially the same as that proposed here. The final version may now be seen in Ch. 3 of "The Organization of the Platonic Corpus Between the First Century B.C. and the Second Century A.D.", unpublished dissertation (on microfilm), Yale University 1974.

## PART TWO

### The Interpretation of Neoplatonism

# Plotinus' Approach to Categorical Theory

by John P. Anton

*Emory University*

## I

Contemporary writers on Plotinus and his Neoplatonism have found it difficult to agree on his definitive position concerning the value and relevance of Aristotle's categories for understanding the nature of the sensible world. W. R. Inge, a generation ago, stated that "the long discussion of the categories in the Sixth Ennead seems to me . . . the least interesting part of the whole book."<sup>1</sup> On the other hand, we have such interpreters as P. V. Pistorius who find this part of Plotinus' philosophy not only theoretically significant but also a definite advancement in the history of the subject. Pistorius has gone as far as to say that "the categories of Plotinus are the expression of his superiority over Greek thinkers before his time."<sup>2</sup> The evaluative aspect of this view need not concern us for the moment. The issue which deserves close examination as being directly related to our theme is whether Plotinus retained the Aristotelian categories in their original meaning as giving a fundamentally correct analysis of the most general properties of sensible objects. Opinion is divided on this crucial issue between (a) those who say that Plotinus subordinated the Aristotelian categories of the sensible to the Platonic Forms of the intelligible world, and (b) those who take the position that Plotinus accepted Aristotle's categories as proposed but limited their usefulness exclusively to the domain of the sensible.

The position I take in this paper is closer to (a) but for a number of reasons I have found it necessary to go beyond its mild claims. Thus I wish to argue here that certain profound

differences in the world-views of Plotinus and the philosophers of the Hellenic period, Plato and Aristotle in particular, led Plotinus to a radical transformation of the metaphysical concepts he borrowed from both Plato and Aristotle. On the theoretical side, it should be noted that whenever Plotinus discusses categorical concepts, he is always viewing Aristotle as an enemy of Platonism;<sup>3</sup> again, it is he, not Plato, who is regarding the highest genera of the *Sophist* as rival categorical principles. On the cultural side, Plotinus' Oriental and strong religious concerns, important as these are to his conception of the One and Good, union with which is the goal of life, as beyond Being, necessarily molded his theoretical orientation and called for a reworking of the significance of (i) the five highest genera of the intelligible world and (ii) the highest types of predication of the sensible world. Hence, when discussing Plotinus' indebtedness to the terminology of his predecessors it is misleading to assume that he puts their conceptual apparatus to the same use. It is the purpose of this paper to exhibit in general outline the basic considerations that define the Plotinian approach to categorical theory and also expose the grounds on which he builds his case for recasting the meanings of categorical concepts.

Two basic considerations appear fundamental to Plotinus' critique and recasting of the classical categorical theories but only one of these pertains to his approach to Plato's highest genera, whereas both are needed in the case of Aristotle's concepts.

1. The One is the source of the Intellectual Principle and hence above predication.<sup>4</sup> Being ultimate, it is beyond the predicative relevance of the highest genera. Furthermore, since the realm to which Plato's highest genera pertain is not ultimate but derivative, their ontological significance cannot possibly be that which Plato assigned to them when he understood them as having ontological primacy.

2. The sensible world for Plotinus is neither ultimate in the Aristotelian sense, nor the work of the Demiurge as depicted in Plato's *Timaeus*. Hence the Aristotelian categories are not the appropriate concepts the sensible realm requires for its intelligibility precisely because its ontological structure and

significance are to be understood in ways that cannot be fully illumined even on Platonic grounds. If so, the referential adequacy of Aristotle's categories must be adjudicated at the level of the Intellectual Principle and only after the logical and ontological significations of the Platonic highest genera have been properly worked out on exclusively Plotinian criteria.

Thus, by way of ordering these tasks we have: (a) the recasting of Plato's highest genera in the light of Plotinus' own view of *Nous* as the first emanation from the One; (b) the recasting of the Aristotelian categorical concepts in the light of the redefined functions of the highest genera designed now to refer to and explore conceptually the Intelligible Realm; (c) the recasting of the Aristotelian categories in the light of (a) and (b) to refer correctly to Plotinus' own view of the nature of the sensible object. Given this program, it should not be too difficult to understand why Plotinus insists on saying that if the same predicates are said of both sensibles and intelligibles, the particular sensibles admit such predicates only equivocally. Thus no problem in the methodology of categorical signification can be solved apart from the fundamentals of Plotinus' ontology.

## II

Philip Merlan adopted the view that Plotinus accepted the Aristotelian categories but limited them to the sensible world:

Plotinus refused to accept any doctrine of categories which would apply the same concepts to the world of the intelligence and that of the sensible. When he developed his own doctrine of categories . . . he applied Aristotelian categories only to the realm of the sensible. As categories of the world of the intellect, he applied the five genera of the *Sophist*. Prophyry did not follow Plotinus; nor did other Platonists.<sup>5</sup>

Professor John M. Rist defended the position of the subordination of Aristotelian (and Stoic) categories to "thoroughly Platonic principles":

Although no one can deny the difficulty and sometimes the tedium of this section of the *Enneads* it has considerable philosophical value. It appears to be the opinion of certain polemical interpreters that Plotinus' whole discus-

sion is misguided—and so it is if looked at solely from an Aristotelian point of view. For the fact is that Plotinus' critique of both the Aristotelian and Stoic categories depends upon certain of his own thoroughly Platonic principles. And these principles need clarification not merely to show the presuppositions with which Plotinus approaches the Aristotelian categories but for their own sake, since in the section of the *Enneads* devoted to the categories we find almost the only passages where Plotinus deals with the metaphysical status of the sensible object.<sup>6</sup>

It would not be necessary to treat these two positions separately since any remarks on the claims of the "subordination" position pertain *a fortiori* to the other. One must readily concede that the immediate impression the reader has from a first reading of *Ennead* VI is that Plotinus, reacting strongly against the Aristotelian principles needed to render intelligible the particularized sensible *ousia*, proceeded to establish a modified version of Plato's highest genera to replace Aristotle's categories. It is a correct impression but it does not take us very far.

Professor Rist is correct in suggesting that we concentrate on understanding the Plotinian position on the status of the sensible object, but to say that the principles upon which Plotinus depends for his critique are "thoroughly Platonic" is misleading. As we hope to show, the context of Plotinus' theory of categories is defined by considerations that are far more Hellenistic than they are Hellenic, and this applies equally to the so-called Platonism of Plotinus. The consequence of the position I take in this paper is that Plotinus may emerge as more original than he is usually taken to be, but also that he departs so far from the classical outlook of Plato and Aristotle as to raise doubts about calling him "the last of the Greeks." In fact, he is closer to the Middle Ages and Renaissance thought, and in a great many cases to modern philosophy than many a historian of philosophy has been prepared to recognize. To this topic we will return later in the paper.

The basic question that awaits an answer is: if we assume that Plotinus has a theory of categories comparable in interest, say, to that of Aristotle and the Stoics, to what entities does his

set of categorical principles pertain and what is their status? In this connection we need to understand what Plotinus had in mind when he discussed the sensible object. Three things must be remembered here: (a) Aristotle and Plotinus differ significantly in their approaches to the sensible realm and hold profoundly diverging interpretations on the nature of the sensible object. (b) Plotinus places the sensible object in a light very different from the way Aristotle does, to the point that his way of understanding the Aristotelian categories of sensible *ousia* is controlled by his determination to relegate the sensible *ousia* to the status of pseudo-substance. Thus, according to Plotinus, the Aristotelian *tode ti*, the *ousia prote* of the *Categories*, is not really *ousia* in the highest meaning of the word; this being the case, the Aristotelian way of understanding the relationship between *ousia* and quality in the sensible object must be rejected. (c) Plotinus deliberately alters the meanings of Aristotle's concepts for the analysis of *ousia* through his own position on the nature of the sensible, to wit, that the sensible is something analysable into a finite number of immanent qualities each of which is dependent on its corresponding form. If I am correct in these observations, it would follow that Plotinus' critique of Aristotle is more devastating in intent than has hitherto been suspected. For it would appear that the Aristotelian categories are not simply inapplicable to the realm of the intelligible; they are inadequate even for the task of understanding the nature and properties of the sensible object. Recognition of this radical aspect of Plotinus' criticism makes him the theoretical forerunner of all modern thinkers who rejected Aristotle's conception of physical substance and the categories as the ultimate types of attribution and property analysis.

### III

Let us assume that Plotinus' uttermost purpose was to delineate the role of reason as paving the path for the soul's union with the One—there is good ground for this position since Plotinus' concern extends beyond that of the knower. In *Ennead* IV. 8. 1, Plotinus speaks unmistakably about his *union with the One*:

Many times it has happened; lifted out of the body into myself; becoming external to all other things and self-centered; beholding a marvellous beauty; then, more than ever, assured of community with the loftiest order; enacting the noblest life, acquiring identity with the divine; stationing within It by having attained that activity; poised above whatsoever within the Intellectual is less than the Supreme: yet, there comes the moment of descent from intellection to reasoning, and after that sojourn in the divine, I ask myself how it happens that I can now be descending, and how did the Soul ever enter into my body, the Soul which, even within the body, is the high thing it has shown itself to be.<sup>7</sup>

It is this ontological union with the source of *being* that determines the place to be assigned to categorical theory and how the highest genera as concepts must be employed for the attainment of the goals of knowledge.<sup>8</sup> It would seem then that if categorical thinking in Aristotle's sense has a role to play in the return or *nostos* of the soul, this is limited to understanding the sensible world, and hence it is only propaedeutic to the higher dialectic employed in the exploration of the intelligible realm. Small wonder, then, that the application of the Aristotelian categories to the ethical, above and beyond the sensible, is abhorrent to Plotinus. To talk of *being* as having many meanings (*pollachōs legomenon*) in the realm of the sensible is one thing, but to do the same in the intelligible realm is quite another.

Be that as it may, Plotinus is unable to accept Aristotle's views on the relevance of categorical theory even to the sensible realm unless the categories are decidedly recast in the light of the Neoplatonic views on ontology so that they may be assigned new functions deriving from a higher authority. It appears, then that Plotinus' position is not just a case of outright or uncritical rejection of Aristotelianism in the field of categorical thought; the issue is further complicated by the complex case of his half-hearted Platonism. If we may speak of his goal in this connection, it seems to involve more than the restoring of the highest genera at the heart of the conceptual analysis of the intelligible realm. More fundamentally, he is concerned with

assigning to these genera new axiological functions above and beyond anything suggested in Plato's *Sophist*.

We must ask: what sort of Platonist is Plotinus? One thing shines clearly throughout the *Enneads*: Plotinus is bent on including into Plato's universe a kind of world which was hardly familiar or even of immediate interest to Plato, but it was a universe Plotinus could not do philosophy without. That Plato's Dialogues lend themselves to a broadening of their conceptual and mythological boundaries is a most relevant fact, but too vast to be treated in this paper. Suffice it to say that Plotinus was neither the first nor the last to inflate and expand the dramatic universe found in Plato's works. The Neoplatonism Plotinus ushered in was one he found in the making and to which he gave a most powerful and decisive direction by intensifying the concern for the intelligible, to be more precise, the *superlunary* or, if one prefers, the trans-physical universe. The outlook was sustained by a religious fervor that found in Plotinus a willing and dedicated advocate. By seeking to complete and round off this outlook, Plotinus shifted also the center of gravity of the ancient world from the naturalistic ethic of the Greeks with its emphasis on the excellences of the *politēs* to the trans-physical quest of philosophical salvation with its unrequited desire for the flight or rather the return to, and union of the soul with, the source of all *Being*. The sensible world, its processes, its principles, kinds of being, its conditions and ends, the environment it provides for human beings, natural and political, the excellences it demands for the understanding and the completion of human happiness, all these and more became secondary concerns and only preliminaries to the new Platonists. They created the trend of reading the *Timaeus* with religious zeal but hardly any concern for Plato's humor, irony, least of all his authentic Athenian passion for the fate and fortune of the Greek *polis*.

What the Neoplatonists on the whole ushered in during the critical times of the late Hellenistic period was a kind of intense awareness of a realm of cosmic existence that could make life worth living and the soul worth having. They cultivated this realm with the dedication of a single-minded lover, bent on inventing even the form of the beloved if he had to do it. It was

the probing into the imaginatively expanded superlunary region of the universe and the tracing of its origins back to the source, its goodness, so to speak, that fired their intellectual imaginations. In the process, they found in this region things Plato never dreamt of, things far beyond the limits of Aristotle's ontology, and in general, things no Hellenic thinker was prepared to acknowledge without serious reservations. Yet it was a realm, in principle at least, familiar to the Greeks, the understanding of which some of the best minds had made it their highest goal. But Plato was not a Neoplatonist; nor was Aristotle. That both had contributed to the logical exploration of a universe far exceeding the boundaries of the sensible domain does not make them Plotinus' intended forefathers, for the Neoplatonic universe, in its ethical and metaphysical aspects, had in a serious way turned its back on the classical outlook.

The Hellenistic mode of philosophizing found in Neoplatonism an effective medium to transpose the levels of value familiar to classical Platonism as levels of supersensible reality. To this spiritual world the Aristotelian categories of being were their sensuous design. Although Plotinus assigned new functions and tasks to the revitalized highest genera of Plato's *Sophist*, he recognized that even the recharging of these principles could not carry the philosopher beyond the level of *Nous*. Even the higher dialectic fell short of what was needed for "the flight of the alone to the alone." This last step toward the final ecstasy Plotinus must take alone. Here he is no longer Plato's disciple. Being neither master nor disciple, he is all by himself, except for Porphyry's witness. In hope of losing the self, he concludes a *nostos* of the soul to the realm where the categories do not obtain and even above that which the higher dialectic illumines. It is a *nostos* that makes Plotinus the first of the non-Greeks.<sup>9</sup>

#### IV

The Neoplatonic conception of the intelligible world to which Plotinus subscribes involves more than a difference in content from what Plato believed it to be. It called for a new approach to the intelligible beings (*noēta ontā*), and hence a

categorical theory appropriate to them. The human act of intellection or *noesis* must be suitable to the object of intellection. To meet his task he needed two things in order to develop an adequate set of categorical concepts: (1) examine the possibilities the Aristotelian concepts have for being redefined so as to serve the Neoplatonic intelligible beings; (2) return to Plato's highest genera of the *Sophist*. Thus, in *Ennead* V. 1. 4, where he discusses "The Three Initial Hypostases," he states:

... the Intellectual Principle is all and therefore its entire content is simultaneously present in that identity: this is pure being in eternal actuality: ... and everything, in that entire content, is Intellectual-Principle and Authentic-Existence; and the total of all in Intellectual-Principle active and Being entire. (MacKenna)

Further in the same chapter he adds the following statement:

Thus the Primals (the first 'Categories,' *ta prōta*) are seen to be: Intellectual-Principle (*nous*); Existence (*on*); Difference (*heterotēs*); Identity (*tautotēs*); we must include also Motion (*kinēsis*) and Rest (*stasis*): Motion provides for the intellectual act. Rest preserves identity as Difference gives at once a knower and a known, for, failing this, all is one, and silent. (MacKenna)

The chapter concludes: "The Intellectual Cosmos thus a manifold, number and Quantity arise: Quality is the specific character of Ideas which stand as the principles for which all else derives" (MacKenna). The variations of this list of *noēta* which we find in VI, 2, 15 and VI, 2, 8 need not concern us here since they do not raise relevant fundamental problems. What is important, however, is to note that Plotinus (a) is not strictly adopting Plato's highest genera, and (b) is using them in novel ways to develop a theory of his own and to criticize Aristotle. Plotinus' understanding of the meaning of the Aristotelian categories, and why they do not apply to his supersensible reality, is clearly stated in *Ennead* VI, 2, 4:

If we had to ascertain the nature of body (*sōmatos physin*) and the place it holds in the universe, surely we should take some sample of body, say stone, and examine into what constituents it may be divided. There would be what

we think of as the substrate of stone; its quantity—in this case, a magnitude; its quality—for example, the colour of stone. As with stone, so with every other body: we should see that in this thing, body, there are three distinguishable characteristics—the pseudo-substance (*hoion ousia*), the quantity (*poson*), the quality (*poion*)—though they all make one and are only logically trisected, the three being found to constitute the unit thing, body. If motion were equally inherent in its constitution, we should include this as well, and the four would form a unity, the single body depending upon them all for its unity and characteristic nature.

The same method must be applied in examining the Intellectual Substance (*ousia noētē*) and the genera and first principles of the Intellectual sphere. (MacKenna)

The important thing to remember here is that what Plotinus is looking for is nothing less than a set of concepts that are neither abstractions nor generic properties of sensible things. All characteristics of sensible reality must be dropped when thought proceeds to comprehend the nature of the Intellectual Principle. Thus, whenever he seems to employ Aristotelian concepts originally designed to apply to the sensible world, he is actually stripping such concepts of all their sensible referential efficacy in order to have them take on a radically new meaning applicable exclusively to the intelligibles; and when they pertain to the sensible entities they do so only homonymously. That is why he says at VI, 2, 4: "It is an Intellectual Being we have to consider, an Authentic Existent, possessed of a unity surpassing that of any sensible thing" (MacKenna). Now this topic brings us to Plotinus' similarities with Plato and his use of the highest genera.

1. Plotinus postulates (when all passages are taken together) the following categories: *Being*, *Motion*, *Rest*, *Identity*, *Difference* and *Nous* or *Thought*, the last one as correlative to *Being*; Plato's highest genera are: *Being*, *Non-Being*, *Identity*, *Difference*, *Motion* and *Rest*.<sup>10</sup>

2. With Plotinus, the Ultimate One is beyond all plurality but includes the One-in-Many (*plethos hen*) of the Intellectual Principle. There is no such principle in Plato, and it

would take quite a bit of straining to interpret the Form of the Good as being the equivalent of the One.

3. The world of the Platonic Forms is a plural world and there is no definitive doctrine in the Dialogues in favor of a unifying principle comparable to that found in Plotinus' system.

4. There is no movement in Plato's world of the Forms. Plotinus interprets motion to be real but supersensible. *Nous* is also movement; its *dynamis* is the efficient cause.

The detailed treatment of any single one of the Plotinian intelligibles and how each differs from its original Platonic correspondent, will require the length of a monograph. Our purpose is not to undertake to demonstrate the actual differences between Plato and Plotinus on any particular doctrinal point, but to indicate the deeper issues that underlie Plotinus' recasting of the metaphysical significance of each of the highest genera. Hence the Plotinian innovations in ontological theory, for instance, the placing of the intelligibles in the Divine *Nous* or the attribution of infinity to *Nous*, and other related doctrines, are sufficient to suggest some of the grounds for Plotinus' transformation of the meaning of certain Platonic concepts which his brand of Neoplatonism mistakenly associated with categorical principles. Be that as it may, without this revision of the Platonism he inherited it is next to the impossible to capture the full effect of his approach to Aristotle's categories.

## V

What remains to be explored in general outline is Plotinus' criticism of the Aristotelian theory of categories. What is relevant to our theme is not the details of the argument or the subtle points in Plotinus' refutations, but rather the broader vision of the Neoplatonic tradition on which he bases his effort to identify and evaluate the usefulness of the Aristotelian view.

Plotinus, because of the fact that he bases his critique on an idealistic, superlunary expansion of the cosmos, a view developing out of a radical shifting from the classical orientation of metaphysical concerns, next to the Stoics, is the first major critic of Aristotle's *ousia*. In other words, he sets the pattern of criticism the purpose of which is to expose the

inadequacy of Aristotle's ultimate types of predicates of beings for a complete account of reality. The basic idea here is that Plotinus shows how a conceptualization of *ousia* and *on*, different from that of classical Aristotelianism, requires a critique and reconstruction of categorical theory. In this sense, Plotinus is more than the leading Neoplatonist who comes to grips with the problem of the categories of being in the late Hellenistic period. He is in a definite sense the precursor of the medieval Arabic, Jewish, and Christian efforts to replace Aristotle's categories with more "adequate" theories; also he sets the tradition for the Renaissance and modern developments in continental philosophy, from Spinoza, Leibniz and Kant to Hegel and the German, British and American neo-Hegelians, that sought to reveal the categories of ultimate reality as process and dialectical movement.

However, the crucial problem in understanding Plotinus' attack rests with the correctness of his interpretation of Aristotle. A careful reading of the text will convince even the most sympathetic of his readers that Plotinus utilizes Plato in order to criticize Aristotle, often with such severity as to cause Porphyry's systematic protestation.<sup>11</sup> The fact remains that Plotinus appears unwilling to accept the full range of Aristotle's meaning of sensible *ousia*. He is equally if not more reluctant to appreciate the relevance of Aristotle's categorical theory to the dialectical clarification of the various theories of soul or the aid it offers toward solving problems of definition as well as fact in the study of living beings. In any event, the Aristotelian model of categorical analysis remains on the whole outside the Plotinian philosophy of method. With Plotinus, the primacy of the sensible object, which characterized much of the classical ontology, steadily vanishes. Thus the categories associated with this sort of ontology recede into the background as concepts of lesser significance. It is no accident that the only place where Plotinus deals extensively with the sensible object is the section where he discusses and criticizes the Aristotelian and Stoic categories. His own view of the sensible objects appears quite close to Plato's but with a heavier accent on the low place it assigns to them in the scale of ontic levels. The sensibles belong to the world of becoming; they are subjects of meaningful

statements, either true or false; they are analyzable into a finite number of qualities—immanent, to be sure—each of which is dependent on its corresponding Form; they admit the same predicates as the Forms but only equivocally; even if called "wholes" they are not true substances but imitations of reality; their essences are not part of their being but to be found only by looking at the Intellectual Principle.

Given this "ontology" of the sensible objects it is small wonder that Plotinus assigns to the categorical theories dealing with their nature a low place in the hierarchy of intellectual tools and rational order. At best, such theories can be regarded as propaedeutic only to yield to the higher dialectic. Equally limited is their usefulness to ethics, for if man is a dweller in two realms, the sensible and the intelligible, it is only the latter which gives knowledge and value. Given the division of realms, categorical thinking about the sensible object receives the significance of its quest from a higher authority. This applies more so to the signification of its constituent concepts. To illustrate this important point, one need only recall here *Ennead* II, Tractate 6, which deals with "quality." It affords a clear-cut case of the recasting of a key concept used by both Plato, Aristotle, and also the Stoics, with reference to understanding certain properties of the sensible object.

Plotinus' way of handling the signification of quality is quite ingenious; it makes the reader suspect that Plotinus is most eager to isolate this concept for special treatment since its troublesome character could prove a source of embarrassment for his system. In addition, Plotinus comes to grips with the category of quality because he is anxious to settle the difficulties he has with explaining the presence of qualities in the sensible objects. The result is that he offers his solution with the aid of subtle distinctions not required by Plato's or Aristotle's ontologies. In other words, we have in this case a clear example of his recasting of a classical concept to suit the demands of a radically different metaphysical outlook.

In effect, Plotinus' position leads to the condemnation of Aristotle's emphasis on inquiry into sensible or natural subject-matters and also a return to an alleged Platonic view which more than heralds the recession of sensible *ousiai* to the

background of ontological investigations. It quite strongly advocates the demise of the Aristotelian model and its replacement by the dialectic of intercategory concepts in the form of reconstituted highest genera. With Plotinus, these concepts were elevated to a higher ontological and axiological place than either Plato or Aristotle were prepared to grant. This is one of the major legacies of Neoplatonism to modern metaphysics. It contributed in no small measure toward giving *Logos* its supremacy over *Being*.

## VI

Plotinus' views in the area of categorical thought came at a time when the transition from the ancient world to another period was gaining momentum and the transformation of concepts and ideas had become indispensable to the needs for intellectual adjustments. What Plotinus did for categorical theory far exceeded his designs for a critique and reconstruction of basic views in metaphysical analysis. He provided a model and a direction which proved influential for many centuries to come. Every extant commentary of the late and post-Hellenistic periods on Aristotle's *Categories* was written by Neoplatonists who interestingly enough in their tone and style followed Porphyry's conciliatory approach rather than Plotinus. Somehow, the realm to which metaphysical reflection turned to satisfy its quest had been substantially delineated by the Neoplatonic vision of the intelligible universe. In the light of these considerations, the present paper was so designed as to consider Plotinus' views on the question of the categories for the purpose of (a) understanding the intent and scope of his theory and (b) placing in proper perspective the critical side of Plotinus' approach to Plato's genera and Aristotle's categories.

The familiar Plotinian commonplace that the ideal world is the archetype of the sensible world is as correct as it is misleading. The difficulty with it is that if taken literally it tends to obscure Plotinus' significant differences with Plato's cardinal doctrines just as it exaggerates those between Plato and Aristotle. Part of the thesis of this paper is the claim that Plotinus is no closer to Plato than he is to Aristotle. His alleged affinity to Plato owes more to the clichés perpetuated by the phrasology of the

Neoplatonic tradition than to the innovations the Neoplatonists introduced in ontology and cosmology in the name of Plato. It is these new winds of doctrine that should count heavily in the comparative analyses of the theoretical affinities between Plotinus, Plato and Aristotle. With Plotinus, we have the appearance of a radically different ontology of the sensible object. If anything, it is non-Hellenic in character. To be more precise, it lies at the heart of an effort to hellenize an already conceptualized Oriental heritage and render it intelligible with the aid of established philosophical concepts to which new meanings had been assigned in order to perform novel cultural tasks. Plotinus proved to be a major force in the transformation of the classical heritage to intellectualize the emerging demands of a new religious ethos. Seen in this light Plotinus should be regarded not as "the last of the Greeks" but the first of the post-classical metaphysicians.<sup>12</sup> In any event, he appears to be the key transitional figure between the ancient and the post-classical modes of ontological thinking.

  7. MacKenna's translation . . . ζωὴν τε ἀρίστην ἐνεργήσας καὶ τῷ θεῷ εἰς ταῦτόν γεγενημένος καὶ ἐν αὐτῷ ἰδρυθεὶς εἰς ἐνέργειαν ἐλθὼν ἐκείνην ὑπὲρ πᾶν τε ἄλλο νοητὸν ἐμαυτὸν δρύσας...
  8. I find it difficult to accept John H. Randall Jr's interpretation of Plotinus. In his article, "The Intelligible Universe of Plotinus," in the *Journal of the History of Ideas* III (1965), 3-16, he states: "In his analysis of the intelligible universe in which we find ourselves, Plotinus starts from the cardinal fact of Greek experience: man is a dweller in two realms, that of the senses and that of thought; and the latter is the 'real' realm in which we alone find genuine knowledge. Plotinus proceeds to elaborate the necessary distinctions within the realm of thought" (9). Randall's position makes Plotinus a "knower," and plays down those aspects that enable Plotinus to seek and claim union with the One. It is the latter side of Plotinus that explains his "Neoplatonism," namely, his radical departure from the classical view of ethics and ontology, and also throws the needed light on his criticism of Aristotle's categories.
  9. Plotinus speaks of the return of the soul to the source of all as an "odyssey," a going back to the fatherland: I. 6. 8. 16; VI. 9. 7. 3 and 9. 9.
  10. Dean Inge adopts the peculiar position that the Platonic categories tend to supercede the Forms in the later Dialogues (II, p. 58). This is questionable doctrine not only because of the problems involved in the comparison between the Forms and the highest genera but also because of the misleading identification of the latter with categorical concepts. There is no evidence in the Platonic Dialogues that Plato meant the highest genera to have this use.

11. See Elias, *In Isagogen*, 39. 6 ff. Simplicius refers explicitly to Porphyry's defence of Aristotle's categories against his teacher's criticisms (*In Categ.* 2. 5 ff); in so doing Porphyry prepared the way for the softer interpretations of this doctrine by later Neoplatonist commentators.
12. Compare, for instance, the view of Clifford H. Moore: "It is evident that Neoplatonism, the last stage of Greek philosophy, is no isolated or strange phenomenon. On its metaphysical side it is the consummation and final synthesis of the whole course of Greek thought from the sixth century to its own day; likewise in ethics it combined the views of its chief predecessors as its leaders understood them; and finally in the doctrine of the soul's union with God it only carried the mystical tendencies of previous centuries to their natural conclusion." *The Religious Thought of the Greeks: From Homer to the Triumph of Christianity* (Cambridge: Harvard University Press, 1916), p. 220.

## *Chorismos* and Emanation in the Philosophy of Plotinus

by John H. Fielder

*Villanova University*

### I. Introduction

For Plotinus, and for Platonists generally, the sensible world is not the only reality. A philosophical examination of this world reveals higher realities of which this world is said to be an 'image'. Thus the problem of *chorismos* is not simply that the higher realities are ontologically 'separate' from the sensible world, but that this separation must be consistent with a very close connection between them. Whatever unity, structure, and value sensibles have is provided by the higher realities despite their ontological separation. The philosophical account of this relationship must, as it were, bring the higher realities into the world without sacrificing their ontologically distinct status. Too sharp a separation tends to preclude any influence, while too close an association tends to eliminate the separation.

One major difficulty is already present in the presentation of the problem, and that is the metaphorical language in which it is stated. To say that the sensible world is an image of a higher reality is to pose the first problem of giving some philosophical meaning to this metaphysical claim.

In Plotinus' metaphysics both of these issues are complicated by another ingredient in his account of the relationship between the sensible world and the higher realities, the doctrine of emanation. Although this doctrine has several functions in Plotinus' philosophy, one of them is to contribute to the account of the relationship between sensible reality and the higher reality of which it is an image. The problem of *chorismos* cannot be fully understood in Plotinus' metaphysics apart from

some view of how sensible reality is brought about as an image emanated from a higher level of existence. We can say that the problems posed by the world as an image must be seen as problems concerning the world as *imaged*.

It is this understanding of the sensible world as something imaged by higher reality that I propose to investigate in this paper. Since this is a very large topic, I have narrowed my inquiry to a single pattern of Plotinus' thought on this issue. Rather than exhibiting all of the many facets of Plotinus' thinking on emanation and *chorismos*, I have chosen to single out one line of his thought and follow up some of its implications.

In order to bring out this pattern of thought with some clarity and in a short space, I have had to ignore many other important issues that are related to this problem as well as overlook many complications and confusions in Plotinus' views. Although the issues I discuss are, in Plotinus' writings, more complex than they are presented here, this approach seems well suited to Plotinus' philosophy. His thought embraces many different philosophical conceptions from diverse sources that are brought together in a frequently uneasy coexistence. Understanding Plotinus' philosophy will in part be achieved by sorting out how particular conceptions and patterns of thought are applied to particular problems. Having clarified particular lines of thinking we will be in a position to more accurately determine where and why Plotinus deviates from it or adopts others. Then we will be able to see more clearly how those patterns of thought work - or fail to work - together. My contribution to this task will be to exhibit one of Plotinus' responses to the problem of *chorismos*, a conception of imaging.

## II. Levels of Reality

For Plotinus the sensible world is incomplete, pointing beyond itself to higher realities. His writings are full of philosophical analyses of sensible phenomena which lead to the conclusion that such phenomena can only be understood in terms of their relationships to non-sensible realities. An examination of beauty reveals the existence of the Form of Beauty and of the soul that grasps it.<sup>1</sup> Knowledge is possible because of

our use of the objects of knowledge, the Forms in Nous.<sup>2</sup> Pain, and sentience in general, requires a non-physical soul to account for the pain in my finger being my pain and not the finger's pain.<sup>3</sup> Natural science points to the role of Nous in the sensible world.<sup>4</sup>

It is not germane to this inquiry to respond to the difficulties involved in determining how many and what kinds of higher realities Plotinus acknowledges as a result of these analyses. What is important here is that these realities form a hierarchy in which each lower reality points beyond itself to something higher. Thus Nous is said to be the image of the One,<sup>5</sup> Soul is likewise the image of Nous;<sup>6</sup> and in general each lower level is the image of its higher, generating reality.<sup>7</sup> The organization of these Platonic entities into a hierarchy is effected by regarding them as a series of images of something higher. Hence the problem of *chorismos* occurs at every junction of higher and lower realities, for at each of these there is ontological separation and the relationship of archetype and image.

The force of this notion of image can be expressed in four characteristics. First, being an image entails being distinguished from that which is the archetype or original. An image is an image *of* something, so that the two are in some sense different things. This alone does not commit one to a view of how that distinction of archetype and image is to be understood, for that requires a further inquiry into what Plotinus understood this distinction to mean in his metaphysical system. At this point only the necessity for the distinction is claimed. Plotinus' view that a lower level of reality is an image of a higher entails that some kind of metaphysical distinction must be drawn between the two or the meaning of "image" is lost.

Second, the notion of image contains the important idea of likeness or similarity. To say that this is an image of that means that some kind of likeness is being claimed. It would not make sense to speak of something as an image unless we can point out that it is an image of *this* rather than something else. Of course, an image - say a painting - can be mistakenly thought to be an image of something or someone other than what it does represent. The portrait of the father may be mistaken for the

son. But it could hardly be mistaken for the family dog, except perhaps in unusual families or circumstances, but even there we could find other things of which it would be impossible for one to think that the portrait was an image of them. Without some kind of likeness we cannot associate the image with that of which it is an image or contrast it with other things of which it is not an image.

Plotinus has this feature of "image" in mind when he speaks of the sensible world as an image of an eternal archetype<sup>8</sup> or eternal model.<sup>9</sup> Plotinus emphasizes that this universe is "a representation carrying down the features of the Intellectual Realm."<sup>10</sup> Plotinus frequently speaks of *Nous* as containing in archetype all of the kinds of things found here.<sup>11</sup> *Nous* is also described as being brought to likeness of the One-Good.<sup>12</sup> Again, this is not to specify the content of this idea of likeness. We cannot assume, for example, that this talk of likeness commits Plotinus to univocal self-predication of Forms, but only that some non-metaphorical account of the similitude of image and archetype must be given if the notion of "image" is used to describe the relationship between levels of reality.

Third, the image is in some way inferior to the archetype. The Platonic use of "image" includes a judgment of the deficiency of the image in comparison to the archetype. This, too, is clear from Plotinus' writings, but the sense of the deficiency is not. Thus Plotinus, in a discussion of emanation, states that "the engendered offspring is always minor".<sup>13</sup> And in V.1.1 the beauty in a statue is said to be "derivative and a minor" in comparison to the Form of Beauty.

In arguing against the Gnostics Plotinus points out that although this world is imperfect in comparison to its archetype, it is the best sensible world possible. "No doubt it [the sensible world] is a copy, not original . . . but to say that it is an inadequate copy is false: nothing has been left out which a beautiful representation within the physical order could include."<sup>14</sup> This world is an image, and therefore deficient, but it is the best image that could be obtained.

When Plotinus speaks of Matter in the sensible world he emphasizes the inferiority of sensibles compared to Soul or

*Nous*,<sup>15</sup> whereas in combating the Gnostics he points out the similarity of image to archetype. There is no inconsistency here, for both likeness and deficiency are contained in the notion of image. It is the relative perfection of the archetype in comparison to its diminished image that results in Plotinus' hierarchy having at its extremes the perfection of the One-Good and the absolute deficiency of Matter. As one proceeds from the One the levels of reality are more and more deficient as a result of the process of each being less than its predecessor, so that the end of the process, Matter, is characterized solely by its deficiency. It is the last, and therefore "pure lack" and "privation."<sup>17</sup> Thus the process of emanation of increasingly deficient realities is used as a proof that there must be a last product of emanation which is the principle of evil.<sup>18</sup>

Fourth, the image is dependent on its archetype. The existence of the image requires the existence of the archetype. Without the archetype the image could not exist. This is clear from the idea of emanation, in which the image must be generated in order to exist. Thus "the offspring is attached [to the generator] by a bond of sheer necessity."<sup>19</sup> Plotinus also speaks of the image as "continuously attached"<sup>20</sup> to the generating reality, meaning that the generating hypostasis sustains the image in its existence, just as the mirror image lasts as long as the object remains in front of the mirror. Just as the idea of image presupposes that of which it is an image, so for Plotinus the existing image is ontologically dependent upon its archetype for its existence.

There is an important complication here that needs to be mentioned. Plotinus sees this dependence as operating in one direction only, so that the lower depends upon the higher but not the other way around. "Not that God the One has any need of His derivatives: He ignores all that produced realm, never necessary to him . . ."<sup>21</sup> But there is a kind of dependence of the higher on the lower in that the creation of an image is a necessary process. The higher hypostasis must create its image as part of its nature. We can extend Plotinus' metaphor and say that one cannot walk away from the mirror.

Given these four characteristics of "image" it is necessary to further specify their philosophical meaning. We need to

explicate each of these aspects of the notion of image. How are the image and its archetype different from each other? In what sense are they similar? What kind of likeness is appropriate here? What does it mean to say that one level of reality is inferior to another? How, exactly, is the image dependent upon the archetype? In general, we need to know how these four characteristics are metaphysical characteristics of Plotinus' system of reality.

One way of putting philosophical content into these four terms - the image as different, inferior, dependent and similar to its archetype - is to determine how they are used in another context where their metaphysical meaning is clearer. The process by which images are generated reveals a philosophical conception of imaging that will provide us with an interpretation of these four characteristics of being an image.

### III. Emanation

As we move from the idea of image to that of imaging, we find that Plotinus employs a variety of metaphorical terms to describe this doctrine. The most common are the sun and its light, heat, cold, perfumes, the growth of a seed, a spring and its waters, a mirror.<sup>22</sup> Each of these metaphors suggests a different sense of generation. The mature plant comes to be only through the destruction of the seed, whereas the sun continues to exist despite its production of light. A spring does not create its waters in the way that an image is created in a mirror, for it makes no sense to ask if the image were existent before the object was in front of the mirror, whereas the water was already in the ground. In a similar way the light does not preexist in the sun before its radiation.

These differences in the logic of the generation metaphors result in differences in the meanings of the four criteria for being an image. Thus the dependence of the mirror image is unlike that of the dependence of the mature plant on the seed. Once the plant is grown its existence does not require the existence of the seed, a situation that it reversed in the case of the image and the mirror. Another obvious example is the senses in which we speak of the image being diminished. Perfumes are weakened or diluted by the air as they are

diffused, but the mature plant, the mirror image, a portrait, are not diminished copies in this way. The spring waters spread out but are not thereby weakened in the sense that heat or odors are weakened by diffusion and dilution.

Obviously we have to settle on one of these metaphors and then determine how it gives meaning to the four characteristics of image that are central to the problem of *chorismos*. Fortunately there is a discussion in the *Enneads* that enables us to do this. In VI.4 Plotinus analyzes the metaphor of light and its source, indicating how that metaphor is to be explicated. The metaphor of light emanating from the sun was especially in need of clarification because of its materialistic origins in Stoicism. Plotinus is always on guard against a materialist conception of reality, and this metaphor had to be carefully dematerialized.

There is a great deal that can be said concerning Plotinus' understanding of light and about the history of that concept in Neoplatonism. But our concern here is only with the philosophical use that Plotinus made of that metaphor in explicating his concept of image and emanation. The passage in which Plotinus is most explicit in such an explication is a famous one and worth quoting at length.

Or imagine a small luminous mass serving as center to a transparent sphere, so that the light from within shows upon the entire outer surface, otherwise unlit: we can surely agree that the inner core of light, intact and immobile, reaches over the entire outer extension; the single light of that small center illuminates the whole field. The diffused light is not due to any bodily magnitude of that central point which illuminates not as body but as body lit, that is by another kind of power than corporeal quality: let us then abstract the corporeal mass, retaining the light as power: we can no longer speak of the light in any particular spot; it is equally diffused within and throughout the whole sphere. We can no longer even name the spot it occupied so as to say whence it came or how it is present; we can but seek, and wonder as the search shows us the light simultaneously present at each and every point of the sphere. So with the sunlight: looking to

the corporeal mass you are able to name the source of the light shining through all of the air, but what you see is one identical light in integral omnipresence. (VI.4.7) (MacKenna translation)

In this passage Plotinus indicates how we are to give a more philosophically precise meaning to the way we speak of emanation and image. In the corrected metaphor the light no longer springs from a center but is simply present throughout the sphere. The material source is eliminated and only the power to illuminate is left to light the sphere. Armstrong<sup>23</sup> claims that this analysis destroys the idea of emanation, but this would be true only if we continued to understand radiation in a spatial sense. The notion of light radiating from one spatial location to a different set of spatial locations is replaced by the conception of one kind of reality giving its power to another, different kind of reality. The reference to a power different from corporeal quality indicates that this incorporeal power is now the source of the sphere's illumination. Instead of A being spatially separate from B and radiating its influence to B, Plotinus proposes that A influences B by its immaterial presence through B. The light in the sphere comes from ('radiates' from) a source but the source is not concentrated in one spatial location. Its 'concentration' is its being a different kind of reality, a principle of illuminating power that is omnipresent in the sphere.

A similar analogy is used at VI.4.12 with regard to sound. The one sound is present to each listener from its source. If we remove the physical source of the sound and leave the power of sound to permeate space, then the analogy with light is the same. Plotinus' shift from the corporeal source to the power of light or sound is a shift from one kind of reality to another. The power to illuminate is ontologically different from a corporeal mass, for the illuminating power can be identically present to many different spatial locations without suffering any kind of partitioning. The discussion recalls Socrates' conversation with the Platonic Parmenides over how sensibles could participate in Forms. At one point Socrates suggested the analogy of the day, which is present without division everywhere, unlike the other

example of the sail, which could cover many individuals only on the basis of a part of the sail for each thing covered.

All of the diffusion metaphors suggest this kind of presence. The perfume that we smell is the perfume itself, dispersed through the air from the source. But the difference between the perfume metaphor and the light is crucial for Plotinus. The particles of perfume that I inhale are not the same individual particles that you inhale. They may be identical in the sense of being the same kind of particles, but they are not the same individuals.<sup>24</sup> For Plotinus, light is immaterial<sup>25</sup> so that it could be identically present to many locations. The light illuminating the sphere, in other words, is one and the same power of light present throughout. Light, because of its immateriality, was exempt from the spatial limitations of corporeal beings who can be present in a variety of locations like the sail, by division into parts. Light was also thought to be indestructible as long as the source continued to exist, an obvious parallel to the eternal generation of the levels of reality in emanation.<sup>26</sup>

In his analysis of the light metaphor Plotinus made it clear that he did not introduce a new kind of separation between the source and its power. He specifically argued against a doctrine of 'presence by powers' in which the higher reality is distinct from its powers which go out from it. The power would be present but the source would not. Plotinus held that "where these powers appear, their source must be with them."<sup>27</sup> and further, "thus, once more, that source itself must be omnipresent as an undivided whole."<sup>28</sup> The distinction between source and power is, for Plotinus, a spurious one, for the powers immanent in sensible reality are the Plotinian *logoi*. Soul contains *logoi* as indwelling powers which enter the sensible world and account for the qualities that sensibles exhibit.<sup>30</sup> Thus the omnipresence of the Soul, which is the subject of VI, 4 & 5, is the immanent presence of the powers of Soul in the sensible world, so that there is no distinction between the *logos* and the power to illuminate, for that power *is* the *logos* present in the sphere.

This conception of immanent omnipresence is found in many places in Plotinus' philosophy, wherever a unity must be

found in plurality. In his view of universals he speaks of the white in two bowls of milk being one and the same whiteness.<sup>31</sup> Soul gives the body unity by being numerically one throughout the plurality of bodily parts and locations.<sup>32</sup> The doctrine of 'sympathy' and the governance of the sensible world by the world soul are further examples of Plotinus' use of this conception.<sup>33</sup>

The conception of imaging as the immanent presence of the generating reality in its image is also found in the One's emanation of Nous. The metaphor of light is again used,<sup>34</sup> and ~~Nous is described as holding the One's light within itself.~~<sup>35</sup> A similar description occurs at V.5.7 where Plotinus speaks of Nous as finding the light from the One within itself. Nous receives power to produce its multiplicity of Forms from the radiation from the One-Good. The One's light is broken into fragments by Nous, resulting in the multiple unities which are the Forms.<sup>35</sup> Rist notes that Plotinus speaks of the One as present with its effects,<sup>36</sup> and this is, for Plotinus, a closer presence in the case of Nous, for Nous is separated from the One only by its being distinct from it.<sup>37</sup>

Plotinus is clearly using the same metaphor of light and of presence associated with it that he explicitly developed in his analysis of the sphere and the light. He has simply transferred the same explanatory terms to the connection between One and Nous that he explained in VI.4 for the relationship of Soul to the sensible world. The plurality of Nous that is filled by the One's power obviously parallels the spatial plurality of the sphere that is illuminated by the omnipresent power of light. And where the One's power is found the One is there also, present in its effects. Hence the One's generation of Nous as its image is quite similar to the Soul's generation of the sensible world for in both instances sees that imaging in terms of the light metaphor and of the immanent presence of the higher reality in the lower.

The relationship between Nous and Soul does not seem to fit this pattern. Although Plotinus does speak of Nous being in Soul, he does not seem to have in mind the kind of immanence characteristic of the light and the sphere. Soul is dependent upon Nous, as its image, and is sometimes described using the

vocabulary of light, but the Soul's function requires a different kind of relationship to its generator. Soul is frequently viewed as a being in the realm of Being, Nous, rather than as a separate hypostasis.<sup>38</sup> Again, Soul is sometimes spoken of as having parts, the uppermost being in Nous, the lower in the sensible world.<sup>39</sup> Both of these roles conflict with the conception of a reality that carries Nous immanently within it. In the latter role Nous is only in one part of Soul rather than omnipresent. Soul also is said to be an emissary from Nous,<sup>40</sup> so that Nous is seemingly separate from Soul which is its messenger.

This is an intriguing problem which is unfortunately beyond the scope of this inquiry. However some further elements will be added to our understanding of the anomalous status of Soul from a consideration of the role of matter in the concept of imaging developed from Plotinus' critique of the light metaphor in VI.4.

We can say, then, that this conception of imaging, though it does not apply to the relationship of Nous to Soul, views the higher reality as generating its image by immanent omnipresence within it. Although this is still not entirely clear, we can at least specify more determinate meaning for two of the four requirements for being an image. We now have a better understanding of how dependence is to be understood. For the image to be dependent on its archetype means that the significant characteristics of the image - its unity, structure, value - are dependent upon the existence of a higher reality that is immanently present throughout the plurality of the image. Without the presence of the generator the image would not be in existence: its very being depends upon the inner presence of a higher reality that fills it and makes it what it is.

The characteristic of likeness is also explicated by this conception of imaging. The resemblance of archetype and image is found in the likeness of the higher reality to the same reality present within the conditions of the lower level of reality. Thus the comparison is between the light principle and the light principle as illuminating the sphere. Such a comparison requires that we be able to separate the light principle from its presence in the sphere so that the immanent reality can be related to the illuminated sphere which is its image. For Plotinus this means

that we must undertake philosophical dialectic in order to be guided to a direct experience of the higher realities. Thus one of the functions of the *Enneads* is to be a spiritual guide to this transcendence of the physical world. Plotinus wants us, through philosophical reflection, to rise to those higher levels of reality and grasp the principles of this world in their purity, apart from their presence in something else. In his discussion of beauty in V.1.1-2 Plotinus distinguishes the beauty that is above the sensible world of art. It exists "in a far higher state than in the art" where the beauty "does not come over integrally into the work." Hence "In the degree in which the beauty is diffused by entering into Matter, it is so much the weaker than that concentrated in unity . . ." The task is to become men who "in the keenness of their sight, have a clear vision of the splendor above." And, as he states in that same discussion, the clue to this transcendence is the realization that "the beauty perceived on material things is borrowed."<sup>41</sup>

It is difficult to talk about this kind of likeness without invoking vision and visual analogies. Light alone in comparison with the light diffused in air is a better parallel than one might at first realize, for Plotinus believed that the air was dark and that light had to overcome this darkness in its diffusion into space.<sup>42</sup> And in the passage where Plotinus speaks of the splendor of the higher realm, he contrasts it with the 'fog and cloud' of earth, again invoking the visual metaphor of something obscured by the surrounding atmosphere. The task of the philosopher is to pierce through the fog rather than ascend from the cave.

Thus the ontological basis for the likeness of archetype and image has been established, although one must rise above one's physical existence in order to actually grasp the likeness.

Two other criteria for image remain and must be explained by extending the inquiry into another area. The concept of matter is used by Plotinus to explicate the ontological distinction between image and archetype, and the deficiency of the image.

#### IV. Matter

The conception of image that is derived from Plotinus' analysis of the light metaphor is completed by the concept of

Matter. Matter explains the ontological distinction between archetype and image, and the diminished nature of the image. Thus it completes the philosophical explication of the four characteristics of image.

There are many passages where Plotinus has this function of Matter in mind. Perhaps the clearest are those in which the light metaphors are extended to these situations. The Soul's relation to Matter is described in terms of the Matter darkening the Soul's seeing.<sup>43</sup> In I.8.14 Plotinus says that "the illumination, the light streaming from the Soul, is dulled, is weakened, as it mixes with Matter which offers birth to the Soul, providing the means by which it enters into generation, impossible if no recipient were at hand." Besides the familiar theme of diffusion (mixing), there is also the explicit statement that Matter is providing the principle by which a different level of reality – the sensible world of generation – can exist. This world is Soul present in Matter.

The same point is made in other passages where Plotinus speaks of Matter as the substratum or base for form.<sup>44</sup> And in II.4.12 he states "No doubt there must be a container, as it were, a place and space; the primary necessity in order for the existence of body, is Matter." Obviously the metaphor of the container is continuous with the language of immanence, as the light is contained within the sphere.

The mixing of Soul with Matter is not to be understood materialistically. It is clear that their relationship is conceived in a way similar to the immanent presence of the light-principle in the sphere: "Matter exists; Soul exists; they occupy so to speak, one place . . . the Soul's separation is simply its not being in Matter; that is, its not being united with it . . ."<sup>45</sup> Like the light in the sphere, Soul is not combined with Matter but is immanently present in the Matter. Or, to use another Plotinian metaphor, the light permeates or pervades the Matter but does not combine with it. This is aptly expressed in this passage dealing with the generation of the Sensible world by Soul: the Soul must pervade all things, and make all, but not be the universe it makes."<sup>46</sup>

A similar situation holds with regard to the role of Intelligible Matter in Nous. The Matter of the intelligible world

is also a substratum, for the Forms in Nous.<sup>47</sup> Plotinus argues that the existence of Form compels the existence of Matter, for we cannot conceive of form without a substrate in which form is lodged. Division and differentiation of a plurality of Forms is possible only with a material principle, just as the sensible world requires its material principle as a container for the powers of Soul. And just as sensible Matter is filled by the immanent presence of a higher reality, so also Plotinus speaks of Intelligible Matter as the 'dark' element in the Intelligible, taking light from outside itself, i.e. the One.<sup>48</sup> Despite the differences of the two realms, Nous is also described in the same terms of generation as the sensible world, the illumination of (Intelligible) Matter by the One. Both material principles provide the matrix in which a higher level of reality is immanently present.

Thus both material principles function as preconditions for the generation of a different level of reality. In passages describing the generation of Nous and the sensible world<sup>49</sup> Plotinus introduces Matter as necessary for a level of reality different from the One or Soul to be generated. Hence Deck states that if Intelligible Matter were removed Nous would be the One.<sup>50</sup> The case of sensible Matter is more complicated because of the difficulty in locating the proper role for Soul, but if we strip away sensible Matter the remainder is the higher level of reality immanent in it.

We can now bring the anomalous position of Soul into sharper focus. If Soul is an hypostasis between Nous and the sensible world, an image of Nous, then the generation of Soul by this model of reasoning so far developed would require a material principle for Soul. But such a principle is conspicuously absent, Plotinus speaking only of the "two orders of Matter."<sup>51</sup> As we noted before and now see more clearly, Plotinus does not use this pattern of thought in explicating the relation of Soul as the image of Nous.

In connection with this anomaly Deck cites a "line of reasoning" in Plotinus in which the intermediation of Soul between Nous and the sensible world is unnecessary because of the sensible world's direct participation in Nous.<sup>52</sup> Wallis also claims that the distinction between Nous and Soul tends to

dissolve, which would leave open the direct participation of the sensible world in Nous.<sup>53</sup> The analysis of this issue is another topic, but whatever explanation we give for Soul's anomalous status must also include an explanation of why Plotinus did not extend this concept of imaging to Soul by providing it with a material principle. It is certainly possible that the tendency of Soul to be assimilated to Nous is the result of the hold that this conception of imaging had on Plotinus' thinking.

Matter also serves to account for the diminution of the lower level of reality that results from the higher level being immanent within it. Again, the light metaphors are adapted to this purpose. The Soul's light being dulled and weakened by the darkness of Matter is an obvious use of the metaphor. We find more explicit passages that make clear that the light metaphor is to be understood in terms of immanence in a principle that differentiates and diminishes: "Forms lodged in Matter are not the same as they would be if they remained in themselves; they are Reason-principles materialized, they are corrupted in Matter, they have absorbed its nature . . . Matter becomes mistress of what is manifested through it . . ."<sup>54</sup> The form in itself is contrasted with the form in Matter, the latter being the cause of the imperfection of the image. The role of Matter in the production of a diminished image is explained a few lines further. "Matter substitutes its own opposite character and kind, not in the sense of opposing, for example, concrete cold to concrete warmth, but by setting its own shaplessness to shape, formlessness to the Form of heat . . ."<sup>55</sup> The reference to heat recalls the diffusion metaphors in which the diffusion of heat through the air results in its being weaker (cooler) than at the source. Similarly Form must bring the formless Matter to form, and in so doing must lose its concentration in permeating Matter. Just as light is weakened through its dispersion in the air so also is form weakened when dispersed into Matter. The principle itself is not so much opposed as diluted. Opposition would require a contrary form — i.e. concrete cold to concrete heat — whereas the kind of process that results in a deficient image is the opposition of formlessness to form, so that the immanent reality generates a diminished image by a kind of dispersal of its energy through Matter.

This conception of Matter appears to identify Matter with a principle of plurality. The unified reality that enters Matter is pluralized by its entry into Matter. The incoming reality is not partitioned by rather dispersed throughout a plurality that results in sensible reality.<sup>56</sup> The higher reality is capable of being identically present throughout that plurality but the resulting immattered reality is thereby diminished, just as the light is diminished through diffusion into space. Hence we can say that plurality is the principle of imperfection for Plotinus, for it is the principle of plurality that results in the generated reality being inferior to its generator. In VI.6.1 Plotinus is quite explicit in identifying this pluralization with diminution. Again using the example of beauty, Plotinus states that "in the degree of the sensible world's extension it was void of beauty and to that degree ugly. Thus extension serves as Matter to Beauty since what calls for its ordering is a multiplicity. The greater the expansion the greater the disorder and ugliness." Beauty, like all form, unifies, and to the extent that multiplicity is present to dilute that unity there will necessarily be imperfection. We can therefore see the truth of Wallis' claim that Plotinus' levels of reality are levels of decreasing unity.<sup>57</sup> The fundamental features of his metaphysical system increasingly seem to be the One as the source of unity and Matter as plurality, with those terms being further identified with Good and Evil.

Intelligible Matter is also a source of plurality. As we saw above, Nous fragments the light from the One with the resulting plurality of unities – Forms – in Nous. The One is present in Intelligible Matter resulting in the first level of multiple reality, Nous. Although Intelligible Matter provides the plurality for the generation of Nous, Plotinus is reluctant to view this as also a principle of diminution. Nous is the image of the One and therefore inferior to it, but Plotinus does not explain that in terms of the plurality provided by Intelligible Matter. Plotinus is always very much concerned to safeguard the Intelligible realm from any kind of disvalue. In the discussion of Intelligible Matter he is careful to point out that, unlike sensible Matter, Intelligible Matter belongs to Being, and has a "life defined and intellectual."<sup>58</sup> But Plotinus seems to be trapped here, for the concept of image requires that the image be inferior to the archetype. And some metaphysical principle is necessary to

account for that inferiority.<sup>59</sup> This is especially true for this conception of imaging in which the One is immanent in Nous. If the unity in Nous is the One, then whatever else is constituent of Nous must account for its deficiency.

Plotinus' refusal to allow Intelligible Matter to be the source of Nous' deficiency contradicts the identification of plurality with deficiency. Intelligible Matter does provide plurality but that plurality is not acknowledged as the source of Nous' being a diminished image of the One. Here, too, this aspect of imaging is not applied or followed through in order to exclude any principle of disvalue in the Intelligible realm.

This analysis supports the claims by Wallis and Deck that the second and third hypostases might be regarded as defective ways of viewing the One,<sup>60</sup> especially since both of them also assert that the distinction between Soul and Nous tends to disappear. For if Nous is the One viewed through Intelligible Matter – i.e. as pluralized into Forms – then Nous is a way of viewing the One since the fragmented unity we see in Nous is the One, grasped through the plurality of Intelligible Matter.<sup>61</sup> Similarly the sensible world can be regarded as a way of viewing Soul (or Nous) through Matter. However, the fact that Soul does not have a material principle means that this explanation will not work for it. If Soul is to be regarded as a defective way of viewing the One, then some other account of how this is to be understood will have to be established.

## V. Conclusion

This conception of imaging answers important philosophical questions concerning emanation and *chorismos*. It gives an account of the generation of lower levels of reality as well as an explication of what is meant by the lower level of reality being an image of the higher. It also brings out the anomalous status of Soul and problems concerning the role of Intelligible Matter in accounting for the image-quality of Nous.

There is a final problem for Plotinus that grows out of this concept of imaging, and that is the attempt to account for the existence of Matter through emanation. Can the material principles themselves be generated or must they be independent

of that process? It is clear that on the model of imaging developed here that Matter cannot be generated. If generation is the immanent presence of a higher reality in a lower by means of a material principle, then the material principle itself cannot be generated without presupposing another material principle. Hence the attempt to generate the material principle on this conception of imaging always results in the positing of another, ungenerated material principle. This is a more philosophically specific way of expressing a long-standing problem in Plotinus' philosophy, his attempt to generate plurality from the pure unity of the One.

Plotinus attempts to view sensible Matter as the image of Intelligible Matter in II.4.5 but it is clear that this attempt must fail if the conception of imaging remains the same as above. Matter's role places it outside the process of unity.

Since the two roles of Matter are similar in providing the plurality necessary for immanence, and the plurality of Nous is superior to that of sensible existence, it is natural that Plotinus would consider the possibility of relating these two similar principles as archetype and image. However these principles are necessarily independent of the One, generated not by emanation but by the kind of explanation Plotinus gives of emanation and *chorismos*

## NOΥΣ as Experience

by Richard T. Wallis

*University of Oklahoma*

As its title implies, this paper is an attempt to clarify the nature of the experience on which Plotinus' account of the Intelligible world is based by determining, first, what anticipations of it, complete or partial, can be found in Plotinus' classical sources and, secondly, what parallels exist in more modern writers or in non-Western religious traditions. That this is a bold undertaking needs no stressing; it is also, as I should admit at the outset, one severely limited both by my own knowledge and by the restrictions of space imposed on a paper like the present one. That I have had to confine myself to accounts known to me is obvious; I hope very much that some of the other participants will be able to supply further parallels. Limitations of space, on the other hand, have forced me to confine myself, first, to accounts obviously based on experience and not mere theory and, secondly, to experiences whose relevance to Plotinus is obvious; hence the omission of many fascinating passages from authors both classical and modern. Finally, I had had in most cases to restrict my own interpretative comments to a minimum, especially since much of the paper had to be taken up with quotations from the relevant sources, particularly those unlikely to be familiar to classicists. Where the parallels to Plotinus are clear, as is happily often the case, the resulting harm is comparatively small, but readers will see that in dealing with Plato and Aristotle I have had to state dogmatically views on disputed questions of classical scholarship and textual interpretation which require argument at much greater length than is possible here. I have, however, tried to phrase my account in such a way as to secure maximum assent

to what I say, with as little as possible dependent on whether my views on such points are accepted. For all these reasons, therefore, this paper can be only a preliminary clearing of the ground and one whose main aim is to inspire others to seek further.

That the most original feature of Plotinus' doctrine of the Three Hypostases is its elevation of psychological experiences into metaphysical realities is now commonplace.<sup>1</sup> And there is no great difficulty in identifying the experiences corresponding to his First and Third Hypostases. The latter is evidently the sphere of discursive thought (*διάνοια*), the process familiar in our everyday lives, discursive (at least as far as the human soul is concerned) in the sense of involving both reasoning from premises to conclusion<sup>2</sup> and simple transition from one object of thought to another.<sup>3</sup> For both these reasons it necessarily involves time; hence Plotinus' famous "psychological" definition of the latter presented at III. 7. 43-5.<sup>4</sup> The First Hypostasis, by contrast, corresponds to the mystics' "undifferentiated unity",<sup>5</sup> "a state in which sensuous imagery and conceptual thought are transcended, the mind becomes perfectly unified and individual limitations are felt to be abolished".<sup>6</sup> Whether Plotinus' mysticism is "theistic", "monistic" or something between the two is the subject of another paper;<sup>7</sup> all that matters here is to emphasize that the "undifferentiated unity" occurs in mystics of *both* types and that the distinction between the One and the Second Hypostasis (*Noûs*) cannot therefore correspond in any form to that between theistic and monistic mysticism (or vice versa).<sup>8</sup> Nor can we identify the experience of *Noûs* with what has been called "extrovertive mysticism", that is, with the vision of a unity running through the external world (as opposed to the introvertive mysticism of which union with the One is clearly an example.)<sup>9</sup> This identification, which has misled some excellent students of mysticism, appears to have originated with Rudolf Otto,<sup>10</sup> whose analysis of Enn. I. 8. 2 certainly shows, as do some passages to be considered later, how much Plotinus' account of *Noûs* has in common with mysticism of this type. But whereas extrovertive mysticism, as Otto rightly states, "knows nothing of inwardness",<sup>11</sup> Plotinus, by contrast, as a good Platonist, is

emphatic that *Noûs* is attained by turning within and leaving sense-perception behind.<sup>12</sup> But what then *is* the experience on which his Second Hypostasis is based? Or, in order not to beg the question, what evidence is there that Plotinus' *Noûs* is experientially based at all, and not a mere theoretical construction out of Aristotelian and Middle Platonic tradition?

That Plotinus' account indeed incorporates a vast amount from these traditions modern studies have proved.<sup>13</sup> Yet scholars, sometimes the same ones, have equally felt that Plotinus' descriptions of *Noûs* suggested an empirical basis. Professor Dodds thus states that "for Plotinus the world of Platonic Forms is already the object of a kind of mystical experience".<sup>14</sup> And in his admirable account in the "Cambridge History of Later Greek and Early Medieval Philosophy" Professor Armstrong has gone further and quoted some specific passages from the treatise V. 8, "On Intelligible Beauty," and the first part of VI.7, "On the Ideas and the One," that lend strong support to this view. Attention may especially be drawn to two passages from the latter treatise; as we shall later see, their exact formulation is sufficiently important to require quotation in full. The first is VI. 7. 12. 23-30. "All flows, so to speak, from one fount not to be thought of as some one breath or warmth, but rather as one quality englobing and safeguarding all qualities – sweetness with fragrance, wine-quality, and the savours of everything that may be tasted, all colours seen, everything known to touch, all that ear may hear, all melodies, every rhythm".<sup>15</sup>

The other is VI. 7. 15. 24-30: – "It might be likened to a living sphere teeming with variety, to a globe of faces radiant with faces all living, to a unity of souls, all the pure souls, not the faulty but the perfect, with Intellect enthroned over all so that the place entire glows with intellectual splendour".<sup>16</sup>

These passages and others, especially those, like the one just quoted, describing the radiant luminosity of the Intelligible world, are one type of evidence that Plotinus has an actual experience in mind. Another is provided by his exhortations to the reader to attain the experience for himself. Thus the passage just quoted continues – (again, we shall see, the exact wording is important): – "But this would be to see it from without, one

thing seeing another; the true way is to become Intellectual-principle and be, our very selves, what we are to see".<sup>17</sup> In similar vein, Plotinus states elsewhere, at the end of a chapter (V. 8. 10) containing a particularly vivid description of Intellectual vision and of the radiance of the world "yonder": — "To those that do not see entire, the immediate impression is alone taken into account; but those drunken with this wine, filled with the nectar, all their soul penetrated by this beauty, cannot remain mere gazers; no longer is there a spectator outside gazing on an outside spectacle; the clear-eyed hold the vision within themselves, though, for the most part, they have no idea that it is within but look towards it as to something beyond them, and see it as an object of vision caught by a direction of the will.

All that one sees as a spectacle is still external; one must bring the vision within and see no longer in that mode of separation but as we know ourselves; thus a man filled with a god — possessed by Apollo or by one of the Muses — need no longer look outside for his vision of the divine beings; it is but finding the strength to see divinity within".<sup>18</sup>

In these passages, as can be seen, a brief hint is given of the way to attain the experience described; we must bring the vision within and no longer see it as a distinct object, but become wholly identified with it. The process is elaborated at greater length in the relatively few passages in which scholars have detected references to the "spiritual exercises" of the Plotinian school, the best known being V. 8. 9. 1. ff.<sup>19</sup> We must first, we are told there, visualise a complete and accurate image of the physical universe; then we must utterly remove from it (and not merely attenuate) its spatial and material limitations, at the same time praying God and the gods of the Intelligible world to enter it. The parallel noted by scholars to the exercises of other religious traditions suggests that such passages are no mere poetic imagery, and thus constitutes a third type of evidence that a definite experience is involved.

If then, we accept this and, leaving such poetically-tinged passages, seek a more cold-bloodedly analytic account of the differences between *Noûs* and our everyday consciousness, it is to such chapters as I. 8. 2 and V. 1. 4 that we must turn. The

main differences, we there learn, are two. First, since *Noûs* contains the totality of True Being and hence has nothing further to seek, its thought is free from change and therefore transcends time; (since Professor Armstrong has cast some doubt on the accuracy of this description, it might be safer to say "transcends time as we know it").<sup>20</sup> Secondly, while discursive thought contemplates its object, as it were, "at a distance," since it cannot attain perfect unity therewith, on the level of *Noûs* there is perfect identity between subject and object and hence complete self-awareness.<sup>21</sup> Some doubt may, however, be felt whether these two points have an empirical basis, since both of them demonstrably derive from reflection on Aristotle's conception of *Noûs*.<sup>22</sup> The former point, *Noûs*'s alleged timelessness, has been fully considered, as stated, by Professor Armstrong, and I do not propose to discuss it further here. The latter point, however, that *Noûs* enjoys perfect unity with its objects, was clearly alluded to in the "empirical" passages already quoted, and we may therefore provisionally take it to be part of the experience. Confirmation of this will be provided by the parallel experiences to be examined later though, as we shall also see, Plotinus' account is by no means free from difficulty). We may finally note two corollaries of the latter point. First, the objects of *Noûs* are Pure Forms, whereas discursive thought, contemplating the Forms at a distance, must be content with images of them, which represent them to her consciousness "as in a mirror".<sup>23</sup> In other words *Noûs* transcends mental images and the faculty contemplating them (*φαντασία*), on which our normal consciousness relies and, for similar reasons, it transcends abstract verbal formulæ; the gods' knowledge is not composed of "premisses, axioms or predicates".<sup>24</sup> The secondary corollary of Plotinus' view of *Noûs* is that each member of the Intelligible world, contemplating as it does the whole of that world, is identical with the whole of that world and with each individual member thereof. "The sun, There, is all the stars; and every star, again is all the stars and sun. While some one manner of being is dominant in each, all are mirrored in every other".<sup>25</sup>

Such then is Plotinus' account of Intellectual vision. But what exactly is he talking about and what anticipations or

parallels exist either in classical Greek thought or elsewhere? The question, it should be emphasised, is not what are the classical Greek antecedents of *Noûs* as a metaphysical hypostasis; this has been exhaustively treated elsewhere. Our search here is rather for antecedents of and parallels to the *experience* described. And here two difficulties arise. First, as even a little investigation shows, the territory between discursive thought and *unio mystica* is filled not by a single experience, but by a whole family of experiences, often with only the barest "family resemblances" between them. Secondly, as is well known, in Classical writers the term *Noûs* is not confined even to experiences within this already large family, but sometimes applied to reason as a whole, while in Hermetic and Middle Platonic texts it is frequently applied to an entity little, if at all, less transcendent than the Plotinian One.<sup>26</sup> I must therefore stress once again that my concern is with experiences which anticipate or otherwise illuminate the nature of Plotinus' Intellectual vision, whether or not the term *Noûs* is specifically applied to them. It will, however, be useful to begin by considering Von Fritz's far too little known elucidation of the original meaning of the term, as revealed by Homer and the Presocratics.<sup>27</sup>

According to Von Fritz "originally and in Homer, *voûs* never means 'reason' and *voeîn* never 'to reason,' whether deductively or inductively";<sup>28</sup> indeed it is not until Parmenides that logical reasoning is consciously included in the term's meaning.<sup>29</sup> In Homer, by contrast, *voûs* is associated with sensation rather than with intellectual thought, but differs from external perception in constituting "a kind of sixth sense which penetrates deeper into the nature of the objects perceived than the other senses".<sup>30</sup> Hence its fundamental meaning "may be defined as the realisation of a situation";<sup>31</sup> for instance, at *Iliad* III. 30 ff., when Paris sees Menelaus, "it is not the sight of Menelaus as such that strikes him, but the realisation that Menelaus has no more ardent desire than to take revenge by killing him on the battlefield".<sup>32</sup> As we shall see, the relation of such insight to the senses is a major point of controversy among the authors we shall consider; the other features of the Homeric conception, by contrast, are more consistently present among them.

First, insight of this type, though often preceded by logical reasoning, is not experienced as the abstract conclusion of such reasoning, but rather as a sudden and immediate realisation. "The process through which we arrive at this conclusion may require considerable time, but the realisation itself . . . usually comes like a flash . . . We are then much more conscious of this sudden realisation which has the appearance of a perception than of mental process which has led to it".<sup>33</sup> Secondly, the function of such insight is not usually conceived as being to provide wholly new knowledge. In Homer, we saw it to denote realisation of a situation's true meaning, whereas in Plato we shall find it affording a direct and more complete insight into truths previously grasped only in the abstract. In Plotinus it was seen to provide a vision of the true archetypal Reality of which this world constitutes a partial image, while yet other writers regard it as bringing out fresh and hitherto unrealised aspects of long familiar facts. It is intuition of this last type that has played so important a part in scientific, and especially in mathematical, discovery.

The role of intuition in scientific discovery has been especially popularized in Koestler's "Act of Creation".<sup>34</sup> Here I am not concerned with the merits or demerits of Koestler's theories, but merely with the fact, already well known to mathematicians, that experiences of this type are by no means rare in the history or thought. A comparison of Greek accounts of *voûs* with those quoted by Koestler, or in the earlier essay of Hadamard,<sup>35</sup> will prove extremely illuminating. Most striking, perhaps, are the accounts of eminent mathematicians quoted by Hadamard and conveniently summarised on p. 115 of Koestler's book. We there find Poincaré referring to the "appearance of sudden illumination, a manifest sign of long unconscious prior work," Hadamard to "the sudden and immediate appearance of a solution . . . without the slightest instant of reflection on my part" and Gauss to solving an enigma "as a sudden flash of light" which comes "not by dint of painful effort, but so to speak by the grace of God." Classical instances quoted by Koestler are Pythagoras' intuition of the world's underlying mathematical harmony and Archimedes' discovery of the principle which bears his name.<sup>36</sup> A parallel from the field of artistic creation is provided by the poet John Masefield.<sup>37</sup> In

his words "instantly the poem appeared to me in its complete form, with every detail distinct . . . This illumination is an intense experience so wonderful that it cannot be described. While it lasts the momentary problem is merged into a dazzlingly clear perception of the entire work in all its detail. In a moment of mental ecstasy the writer . . . perceives what seems to be an unchangeable way of statement." In such cases, it would appear, the data relevant to the problem in hand had been previously amassed, but after a period in which the discursive intellect had considered them without apparent success, had been laid aside until an appropriate stimulus suddenly precipitated their emergence into consciousness in an instantaneous blaze of light. The same schema of four stages — (1) amassing data, (2) logical reasoning, (3) unconscious incubation and (4) sudden vision — would appear to be present in those cases where there is neither problem nor solution, but simply a vivid and direct insight into truths previously known only as abstract propositions. A case of the latter type would appear to be what is described in the Seventh Platonic letter.

I do not propose to consider here, nor have I space to do so, whether the Letter is a work of Plato's old age or one composed by a close disciple shortly after his death — a question on which I personally have an open mind. Nor, more regrettably, have I the space to argue, what I would maintain emphatically, that in either case its philosophy is on all essential points Platonic.<sup>38</sup> Here I must limit myself to the experience of which the Letter's philosophical digression provides an account.

At 341 C in the Letter occurs the famous denial that the science of ultimate truth is expressible in words like other sciences. It arises, we are told, only after long philosophical communion concerning the subject, when a light suddenly springs up in the soul and thereafter nourishes itself.<sup>39</sup> The reason, we subsequently learn, is the inadequacy of "the four," names (*ὀνόματα*), definitions (*λόγοι*), sensible images (*εἰδωλα*) and human knowledge based on these,<sup>40</sup> to express the nature of "the Fifth," i.e. the Pure Form (342 A ff.).<sup>41</sup> It is, of course, fundamental to Platonism that sensible images are only inferior imitations of the Forms. Similarly names are not fixed to objects by nature and nor are definitions, since they are

composed of nouns (*ὀνόματα*) and verbs (*ῥήματα*). Hence all four are defective in that they express only a thing's quality (*τὸ ποῖον τι*) instead of its essence (*τὸ τί*) (342 E - 343 C). But it is only by first grasping these four that one can subsequently attain knowledge of the Fifth.<sup>42</sup> It is by passing through the four, "ascending and descending to each in turn," that true knowledge can be generated with difficulty in the souls of intellectually and morally suitable pupils.<sup>43</sup> After "rubbing them against one another" wisdom can finally be made to shine forth within such disciples.<sup>44</sup>

The Letter's philosophical digression, of which the above was a necessarily short and inadequate summary, thus forms the most detailed description of the psychology of the philosopher's supreme vision to be found in the Platonic Corpus. The echoes of the accounts of intuition quoted earlier are no less evident. As I have stated, I cannot argue here, what I think can be proved, that its teaching is on all major points consistent with that of the dialogues; nor can I discuss the problems posed by the Letter's technical terminology, problems by no means unparalleled in Plato's certainly genuine writings.<sup>45</sup> It is, however, clear that the Letter describes two ways of knowing the Forms, an imperfect way based on words and on the Forms' sensible images, and one that is at least more nearly adequate and which transcends these. Similarly, it will be recalled, one of the two points in which *νόησις* in the Republic was claimed to be superior to *διάνοια* was in dealing with the Forms themselves and making no use of their sensible images (*εἰκόνες*) (the other, of course, being its ability to rise above hypotheses to the unhypothetical First Principle of the Good) (510 B, 511 A ff.). What is unfortunately less clear in the Republic is whether both faculties are concerned with Forms, or at any rate with the same type of Form.<sup>46</sup> It is sufficient for our purposes, however, to observe, first, that no one doubts, and Plato explicitly states, that the objects of *νόησις* are the Forms themselves (510 B, 511 C) and, secondly, that he further states that the objects of *διάνοια* become objects of *νόησις* "in conjunction with a First Principle".<sup>47</sup> We may therefore take it that *νόησις* affords a more perfect knowledge of the objects initially known through *διάνοια* and that these include some, if not certainly all, the

Forms.<sup>48</sup> Similarly the *Cratylus*, a dialogue in which the role of words (or more especially of names)<sup>49</sup> as images of Realities is examined at length, refers to the need for a faculty that will grasp Realities by themselves (*αὐτὰ δι' αὐτῶν*) and independently of names (*ἄνευ ὀνομάτων*), since only so can we be sure that our application of names is correct (438 D-E). Here again, however, it is far from clear at first sight that the Realities mentioned are the Forms. The view that they are can be supported, first, by the mention of the Forms towards the end of the dialogue<sup>50</sup> and, secondly, by the fact that only so can we suppose the procedures described in the *Cratylus* to have serious philosophical significance.<sup>51</sup> Finally we may compare the terms in which Socrates describes the nature of the faculty in question as too hard for him or Cratylus to determine<sup>52</sup> with *Republic* 506 D-E, where Socrates disclaims ability to give an account of the Good, and 533 A, where he declares that Glaucon will be unable to follow an account of Truth itself as opposed to an image thereof.<sup>53</sup> It is thus natural to infer that the faculty alluded to in the *Cratylus* is *νόησις* and that its objects, as in the *Republic*, are the Forms. In this case the doctrine of the two works, and of the Letter, would, thus far at least, be substantially identical.

Unfortunately, as has been objected, it is hard to see what a form of knowledge entirely independent either of words or of sensible images would be like.<sup>54</sup> That the passages just considered speak of the possibility of such a knowledge is clear enough. But it is certainly possible that Plato has been led to exaggerate in the sense that all he would seriously wish to maintain is that such knowledge is *no longer dependent* on words or images, not that it does without them altogether.<sup>55</sup> This, however, is not necessarily so, since we found Plotinus likewise maintaining that *his* Intellectual vision does without words or images. But of course, to note that the two philosophers agree, at least verbally, on the point mentioned neither makes the nature of such knowledge any clearer nor even establishes that it can exist at all. For the present we need merely note the difficulty; we shall have occasion later to return to it.

In general, moreover, despite the two philosophers' agreement on the above-mentioned point, the Seventh Letter's account of the supreme vision seems decidedly less intense (to use a convenient term), that is to say, less mystically-tinged and closer to the world of our everyday experience than that given by the *Enneads*. In particular it seems much closer to the mathematical intuition described by us earlier. There is, of course, a more mystical tone to the visions described in the *Symposium* and the *Phaedrus* (not to mention the enigmatic allusion to the Form of the Good in the *Republic*). The *Symposium* vision, however, is concerned solely with the Form of the Beautiful, not with the whole world of Forms. And even in the *Phaedrus*, which of all the dialogues comes closest to the Plotinian vision, it is noteworthy how many features of that vision are lacking. The timelessness of Plotinus' *Noûs* is indeed partially anticipated by the instantaneousness of the visions of the *Symposium* and the Seventh Letter.<sup>56</sup> But there is no suggestion in Plato of the Soul's identity with the Intelligible world or of the mutual identity existing between that world's members. The union of subject and object in Intellectual vision may be partially anticipated in the metaphors of sexual union applied by Plato to the Soul's contemplation of the Forms, but their significance is greatly lessened when we recall that he applies them no less to the soul's contact with the objects of sense-perception.<sup>57</sup> It seems therefore that we must look elsewhere for the closest parallel to Plotinus' Intellectual vision.

Nor will Aristotle advance our search very far. This statement may seem astounding in the light of the very large Aristotelian component in Plotinus' conception of *Noûs*, which I certainly do not wish to contest.<sup>58</sup> Here, however, we are seeking anticipations of the experiential rather than the metaphysical side of *Noûs*, whereas it would appear from such points as Aristotle's arguments for the self-awareness of *Noûs*,<sup>59</sup> that his position rests on theoretical rather than experiential grounds. It is especially noteworthy that his argument in the *De Anima* is paralleled by, perhaps even based on, his argument for the self-awareness of sense-perception,<sup>60</sup> and that it depends on the "informing" of the soul by a mental image,<sup>61</sup> whereas in Plotinus *φαντασία*, like sense-perception,

precludes the possibility of pure self-awareness.<sup>62</sup> This conclusion might have to be modified if more of Aristotle's early works survived – in particular if it could be proved that in them he had allowed the possibility that the soul may attain a direct vision of her own nature,<sup>63</sup> an idea of which the later passages would then be relics. This, however, must remain speculative. It is clearly true that the fragments of Aristotle's early works show decided echoes of the Platonic view of intuition.<sup>64</sup> But if we turn to the accounts of *νοῦς* in the *Analytics* and *Ethics*,<sup>65</sup> we find that, so far from going beyond Plato, Aristotle significantly restricts the capacity of *νοῦς* in comparison with his master.

The most obvious difference between the two is that whereas for Plato, at least in some and perhaps in all cases, *νοῦς* and *ἐπιστήμη* had been concerned with the same objects, for Aristotle this is no longer true. Or perhaps we should rather say (to keep our account consistent with our earlier observations) that the two faculties deal with different *aspects* of our knowledge, scientific knowledge (*ἐπιστήμη*) having as its object truth reached by discursive syllogistic reasoning, whereas the function of *νοῦς* is to apprehend the first principles (*ἀρχαί*) implicit in all our reasoning and on which that reasoning depends, but which cannot themselves be reached by syllogistic reasoning.<sup>66</sup> Aristotle indeed makes two concessions to the Platonists, first that perfect knowledge is impossible without grasping the first principles on which that knowledge rests (*N. E.* 1139b 31 ff.), and secondly that intuition is more accurate than knowledge reached by discursive reasoning (*Post. An.* II. 19. 100b 8-9). But he maintains against Plato that there is no more perfect means than demonstration of knowing demonstrative truth (*Post. An.* 83b 34 ff.). And the superior accuracy of *νοῦς* depends on a further difference between the two faculties, that, whereas discursive thought involves the combination of concepts, *νοῦς* has as its province the apprehension of simple concepts and is therefore infallible.<sup>67</sup> We may further note that the gulf between *νοῦς* and sense-perception appears less wide in Aristotle than it had been for Plato. Thus *Posterior Analytics* II. 19 appears to conceive of a continuous process from the intuitive apprehension of the simplest universal concepts out of the data of sense-perception to the apprehension by *νοῦς* of the

ultimate principles of all such reasoning. And while *Nicomachean Ethics* VI declares *νοῦς* and the practical man's common sense to be opposed in the status and dignity of their objects (1142 a 25 ff.), Aristotle's subsequent discussion reveals strong analogies between the operations of the two faculties and thus associates them in a way with which Plato would have had little sympathy.<sup>68</sup> A more detailed comparison of the two thinkers' views both with one another and with modern accounts of intuition would be a fascinating and illuminating exercise. It would not, however, bring us any closer to an understanding of Plotinus, and cannot therefore be pursued further here.

The difficulty posed by writers of the Hellenistic-Roman period is a different one. It is not that there is any lack in their writings of experiences going beyond normal consciousness. As writers such as Dodds and Festugiere have shown,<sup>69</sup> writings such as the *Hermetica* and those of Philo, the Gnostics and the Middle Platonists reveal a profusion of such experiences, experiences recalling Platonic – Aristotelian intuition,<sup>70</sup> mystical or quasi-mystical experiences foreshadowing Plotinus' Union with the One,<sup>71</sup> prophetic experiences, experiences of divinisation, extrovertive mystical experiences,<sup>72</sup> as well as not a few experiences whose interpretation is thoroughly ambiguous. What we do not find, as far as I am aware, is a detailed account clearly anticipating Plotinus' description of Intellectual contemplation,<sup>73</sup> and, even if we are looking for detailed accounts bridging the gulf between that experience and those considered earlier, our harvest will be disappointingly small. The danger, in short, is that, so far from advancing our understanding of Plotinus, the Hellenistic-Roman texts will merely complicate our problem by adding a vast number of further experiences themselves needing elucidation and classification. At all events, such an inquiry cannot be undertaken in a paper like the present one. I shall therefore confine myself to a single account, which goes some way towards bridging the gulf referred to and which has significant links both with Plotinus and with some parallel experiences which we shall consider.

The text in question is Philo's well-known description at *Migr. Abr.* 31-35 of his own literary inspiration. Sometimes he

relates, despite having in his mind a clear conception of the subject on which he intends to write, he has been unable to produce any work, whereas at other times, "coming to work empty," he has suddenly (*ἐξαίφνης*) become full of ideas "invisibly showered upon him"<sup>74</sup> and thereby attained a vivid and direct vision of what to say. In his own words he attains "language, ideas, an enjoyment of light, keenest vision, pellucid distinctness of objects, such as might be received through the eyes as the result of keenest shewing".<sup>75</sup> Under the influence of divine possession he further becomes unconscious of his surroundings, of those present and even of himself and of what he is saying and writing.<sup>76</sup> At such moments of "release," he writes, the mind gives up its own activities and abandons its will to a higher inspiration.<sup>77</sup> Finally we may note Philo's contrast between such inspiration and the laborious processes that normally occupy the mind<sup>78</sup> and his consequent stress on the superior excellence of the products of inspiration.<sup>79</sup>

The resemblances between Philo's account and those considered earlier are obvious, in its stress on the suddenness and clarity of intuitive insight and its contrast between the effortlessness of intuition and the laboriousness of the mind's usual processes, as also between periods of sterility and of inspiration. Only three further features require special comment. The first is the Jewish contemplative's description of his experience in terms of prophetic inspiration and his consequent ascription of it to divine power. The "grace of God," which for Gauss was a mere metaphor,<sup>80</sup> is meant by Philo in real earnest. The second is Philo's reference to surrendering his individual will, a point to which we shall return. Finally there is his statement that the vision brings oblivion of one's surroundings and even of oneself. In this respect it appears somewhat more intense and further from our normal consciousness than those described earlier and to mark an intermediate stage between them and Plotinus' account of the Intelligible world. It may also be regarded as intermediate between the latter and the experiences to which Plotinus appeals in support of his claim that consciousness (of the type familiar to us)<sup>81</sup> has a blunting effect on our activities. When we are absorbed in reading or an act of bravery, he states, we have no awareness that we are

performing those actions; such awareness arises in proportion as our absorption in them grows less (I. 4. 10. 21-33). Philo's experience resembles such cases in involving action (in this case writing) in the sensible world, but his references to inspiration give it a deeper, more mystical tone.

An experience which comes even closer to bridging the gulf between Plotinus and the writers so far considered is the aesthetic contemplation described by Schopenhauer, from whom it will therefore be desirable to quote a fairly lengthy passage. A further reason for doing so is furnished by Friedlander's observation that while by "confining the intuitive to the aesthetic," Schopenhauer made his account of the Platonic Idea unduly restrictive," apart from this, however, Schopenhauer had a more profound understanding of the intuitive element in the Idea than anyone else in recent times, no doubt because what he found in reading Plato coincided with his most personal experience".<sup>82</sup> After declaring, like our previous sources, that the vision comes "suddenly," the relevant passage continues as follows:<sup>83</sup>

"If, raised by the power of the mind, a man relinquishes the common way of looking at things, gives up tracing, under the guidance of the forms of the principle of sufficient reason, their relations to each other, the final goal of which is always a relation to his own will; if he thus ceases to consider the where, the when, the why and the whither of things, and looks simply and solely at the what; if, further, he does not allow abstract thought, the concepts of the reason, to take possession of his consciousness, but instead of all this, gives the whole power of his mind to perception, sinks himself entirely in this, and lets his whole consciousness be filled with the quiet contemplation of the natural object actually present, whether a landscape, a tree, a mountain, a building, or whatever it may be: inasmuch as he *loses* himself in this object . . . i.e., forgets even his individuality, his will, and only continues to exist as the pure subject, the clear mirror of the object, so that it is as if the object alone were there, without any one to perceive it, and he can no longer separate the perceiver from the perception, but both have become one, because the whole consciousness is filled and occupied with one single sensuous picture, if thus the

object has to such an extent passed out of all relation to something outside it, and the subject out of all relation to the will, then that which is so known is no longer the particular thing as such; but it is the *Idea*, the eternal form, the immediate objectivity of the will at this grade; and, therefore, he who is sunk in this perception is no longer individual, for in such perception the individual has lost himself; but he is *pure* will-less, painless, timeless *subject of knowledge*".

The resemblances between the above passage and Plotinus are clear. Both describe a vision transcending spatio-temporal restrictions and abolishing the subject-object distinction.<sup>84</sup> The Schopenhauer passage, furthermore, agrees with Philo that the vision involves abandonment of one's individual will, just as for Plotinus it is the "will to belong to oneself" that leads the soul to leave the Intelligible world and forget her true identity.<sup>85</sup> Hence return to that world for him as for Plato, involves a moral as well as an intellectual purification;<sup>86</sup> indeed, since what we contemplate depends on what interests us, the two are linked and the soul's return "yonder" abolishes not merely all interest in the sensible world and one's separate existence therein, but all consciousness and memory of these.<sup>87</sup> Finally, Plotinus' account of *Noûs* as the Totality of Being is echoed in Schopenhauer's vision of the World as *Idea*, in which individual limitations are transcended and the whole world is felt to depend on one's own consciousness. This point Schopenhauer summarises in the Upanishadic dictum "*haec omnes creaturae in totum ego sum, et praeter me aliud ens non est*".<sup>88</sup> Yet, despite these resemblances, there is the contrast that for Schopenhauer the way to attain the vision is to lose oneself in an external object of perception, "a landscape, a tree, a mountain, a building," etc., so that "the whole consciousness is filled and occupied with one single sensuous picture." This experience is therefore clearly of the *extrovertive* type and thus, as we have seen, to be contrasted with Plotinian contemplation. The closest parallels to that contemplation must therefore be sought elsewhere.

There are to be found in Indian mysticism. Both Hindu and Buddhist mysticism distinguish between contemplation of the Realm of Pure Form (Buddhist *rūpa* jhana, Hindu *savikalpa*

*samadhi*) and contemplation of the Formless realm (Buddhist *arūpa* jhana, Hindu *nirvikalpa* *samadhi*), and the traditional accounts leave no doubt that these are both levels of *introvertive* contemplation. The obvious reflection that we have here a parallel distinction to that in Plotinus between *Noûs* and the One receives powerful support from a modern description of the Buddhist scheme, that of Lama Anagarika Govinda, which it will therefore be desirable to quote in full. I say "powerful support," however, and not "confirmation," since it is to be feared that the German-born author may have been influenced by Plotinus and by Plotinian-influenced German idealists in writing it. But though caution must obviously be used in evaluating what he says, I have found that most of his substantial points can be verified from other Buddhist writers. Before attempting a detailed analysis, however, it is best to set out what he has to say.<sup>89</sup>

"Between the two extremes, the domain of the sensuously bounded, or of form bound by craving (*kāmadhātu*) and the domain for [sic.] the formless (*arūpadhātu*), the unlimited that is free from craving, there comes in intermediately a group of objects which are not perceptible indeed to the lower senses, namely those (of contact, of the non-spatial) of smell, of taste and of touch, but certainly to the higher senses, in so far as these are free from all entanglement with the ego, that is, free from discordance (craving), and therefore able to merge completely into the object, to become one with it, to experience it from within. These objects are designated as pure forms, untarnished by any kind of entanglement with the 'I' or as absolute form (*rūpa*), since they belong neither to the domain of the formless (they possess shape), nor yet correspond to the sensuous form bound by craving. The realm of Pure Form (*rūpadhātu*) is thus not a domain of intellectual abstractions but of intuitive (because 'I' — freed) contemplation of form. Corresponding to these three groups of objects, we get three basic planes of consciousness; the consciousness which dwells in the domain of the sensuous, of forms of craving (*kāmāvacara-citta*); the consciousness which dwells in the domain of Pure Form (*rūpāvacara-citta*); and the consciousness which dwells in the domain of the Formless, of Non-Form (*arūpāvacara-citta*).

The Realm of Pure Form is intermediary between the other two realms inasmuch as it has something in common with each of the two – with the sense-domain, the property of form-ness; with the formless domain, the property of abstraction, namely from the egocentricity of the lower domain of the senses filled with desires. That this is no mere artificial, intellectual abstraction, follows from the intuitive character of these two domains. The properties of each domain are not something added to their particular character, but only modifications of the same. Thus the sense-world is designated as partly the domain of sensuous desires, since its objects are bounded, 'I' – conditioned, in their individualness set in contrast with the subject, incapable of union with the subject, and hence beget the state of tension (dualism) which we call craving. The objects belonging to the realm of Non-Form possess no limiting boundaries, are beyond all multiplicity and every kind of isolation or 'I'-entanglement. With this is excluded all possibility of tension, of craving. It is the same with pure forms, for their boundaries are only of an ideal, a formal sort, they are not essential to them and can therefore be filled by the experiencing subject."

For those who know the Enneads the above passage will have a very familiar sound. How close the resemblances really are and how far they are due simply to Neoplatonic reminiscences in the mind of its author may best be ascertained by an analysis of its contexts. Six points may be singled out: –

1. The World of Pure Form is intermediate between the realm of discursive thought and the purely formless domain, with both of which it has something in common.
2. It is thus characterised by a purely intuitive contemplation, to be contrasted with discursive thought.
3. It breaks down the barrier between subject and object found in normal thought and perception.
4. It involves relinquishment of the ego and of sensual craving.
5. Its objects are Pure Forms.
6. These are perceptible only to the higher senses (sight and hearing) in so far as they are able to merge with their object and experience it from within.

The resemblances between the first five of the above points and Plotinus' account of *Noûs* are evident enough; indeed the first three of them are so basic to it that no more need be said. With point four, that intuitive contemplation involves abandonment of sensual craving and one's own will we have dealt sufficiently in connection with Schopenhauer; it is equally fundamental for Buddhist contemplatives that meditative absorption requires relinquishment both of sensual desire and of discursive thought,<sup>90</sup> while the statement that it abolishes the subject-object distinction is also found in sources not open to the suspicion of Neoplatonic influence.<sup>91</sup> Hence when both Plotinus and the Buddhists describe the objects of intuitive contemplation as Pure Forms we may conclude a priori that here too they are likely to be talking about the same thing, despite the obscurities of their accounts. (Thus on the one hand we read that Pure Forms "have shape," on the other that "their boundaries are only of an ideal, a formal sort, they are not essential to them.") The only major divergence between the two accounts concerns point six; for, as we have seen, for Plotinus *Noûs* involves complete abandonment of sense-perception and mental images, whereas for the Buddhists, as for Schopenhauer, it involves merging the senses with their objects. Not only, however, will it be recalled that we found Plato and Plotinus extremely obscure as to what contemplation without mental images would be like; if we refer back to Plotinus' accounts of *Noûs*, with their rich sensuous imagery, and especially to VI. 7. 12. 23-30's comparison of it to "one quality englobing and safeguarding all qualities," we may wonder whether his experience may not in fact be closer to that of the Buddhists than his formal theory allows. Is he not, in fact, attaining it by merging his (inner) senses with their objects? At least we may ask him and Plato how, if the Intelligible world is as removed from sense-experience as they claim, it is legitimate to use sensuous imagery of that world at all. Even so the resemblance to the Buddhist position would still be incomplete, since the Plotinus passage refers to scent, taste and touch, whereas for the Buddhists only sight and hearing have a place in the Form World.<sup>92</sup> And it may also be felt that the nature of the experience in question remains obscure, whichever formulation is correct. But such obscurity is evidently inherent in any

experience going beyond our normal consciousness, and the only remedy, as all the authors in question assure us, is to undertake the arduous course of training necessary to attain such experience for ourselves.<sup>93</sup>

Recent years, however, have brought us what in many quarters is regarded as a short cut to such experiences, by means of psychedelic drugs. That I have left dealing with these until now is due once again to the tremendous *variety* of experiences involved and the danger, as before, that so far from finding illumination for our problem we shall find ourselves faced with a vast new family of experiences, themselves needing clarification. Nor do I propose to deal with the vexed question whether psychedelic drugs can produce mystical experience and, if so, what kinds of mystical experience. All I propose is to quote two accounts of such experiences which on significant points recall Plotinus' description of *Noûs* and thus provide final confirmation that his description is indeed experientially based. I shall add as little explanatory comment of my own as possible since most of the resemblances, and their implications, should be clear from our previous discussion.

The first passage is the account by a modern American journalist of his experience under mescaline.<sup>94</sup> This experience appears to differ from that of Plotinus in being of the extrovertive type, but, as in other extrovertive experiences, the echoes of Plotinus (in the words italicised), are clear enough. What is unfortunately unclear is how far they result from reminiscences of the *Enneads* on the author's part; all that can be said is that his references to Plotinus elsewhere do not suggest profound or detailed acquaintance.<sup>95</sup> A second significant difference is that the passage to be quoted is an account of a "bad trip." Thus, while Plotinus stresses the "ease" and "gentleness" of the Intelligible world,<sup>96</sup> the American journalist feels only meaninglessness and horror. Hence, presumably, his insistence that "we were not God." Once again, I refrain from discussing whether this is a correct interpretation of the experience; here it is only the experience and the resemblances to Plotinus that concern us.

"Finally it all fell together, and I remembered who I was. And it was all so simply, really, *I was life, I was being, I was the vibrant force* that filled the room, and was the room. *I was the*

*world, the universe, I was everything. I was that which always was and always would be. I was Jim, and Jim was me, and we were everybody else; and everybody else was us, and all of us put together were the same thing, and that same thing was the only thing there was and all that there was wasn't God. It was us, alone. And we were each other, and nowhere anywhere was there anything else but us and we were always the same, the one and only truth"* (my underlinings).

The second passage is the account by the modern Buddhist writer John Blofeld of a 'high Yogic' experience also achieved through mescaline.<sup>97</sup>

"Suddenly there dawned full awareness of three great truths which I had long accepted intellectually but never, until that moment, experienced as being fully self-evident. (I quote only the first of these, R. T. W.) Now they had burst upon me, not just as intellectual convictions, but as experiences no less vivid and tangible than are heat and light to a man closely surrounded by a forest fire.

There was awareness of undifferentiated unity<sup>98</sup> embracing the perfect identity of subject and object, of singleness and plurality, of the One and the Many. Thus I found myself (if indeed the words 'I' and 'myself' have any meaning in such a context) at once the audience, the actors and the play. Logically the One can give birth to the many and the Many can merge into the One or be fundamentally but not apparently identical with it; they cannot be in all respects one and many simultaneously. But now logic was transcended. I beheld (and myself was) a whirling mass of brilliant colours and forms which, being several colours and several forms, were different from one another — and yet altogether the *same* at the very moment of being different! I doubt if this statement can be made to seem meaningful at the ordinary level of consciousness. No wonder the mystics of all faiths teach that understanding comes only when logic and intellect are transcended! In any case, this truth, even if at an ordinary level of consciousness it cannot be *understood*, can, in a higher state of consciousness, be directly *experienced* as self-evident. Logic also boggles at trying to explain how I could at once *perceive* and yet *be* those colours and those forms, how the *seer*, the *seeing* and the *seen*,

the *feeler*, the *feeling* and the *felt* could all be one; but, to me, all this was so clearly self-evident as to suggest the words "childishly simple."

In quoting this passage a modern psychologist notes significant points on which it recalls the accounts of intuition given by such philosophers as Spinoza and Bergson:<sup>99</sup> the resemblance between the sudden illumination of Blofeld's first paragraph and that described in the Seventh Platonic Letter is equally striking. No less remarkable is the resemblance between the second paragraph and Plotinus' account of the unity-in-diversity of the Intelligible world, the mutual identity of its members and the unity between subject and object on which this depends. This last point, of course, was equally noticeable in the first psychedelic experience we considered, but, since Blofeld makes no reference to a transfiguration of the external world, his account would seem more clearly an experience of the introvertive type and therefore closer to Plotinus. On the other hand his reference to "a whirling mass of brilliant colours and forms" ("forms" here clearly meaning no more than "shapes") suggests an experience which, though paradoxical, is decidedly less intense and less mysterious than Plotinus' intellectual vision, and experience in fact intermediate between Plotinus' *φαντασία* and his *Noûs*, resembling the latter in involving union of subject and object, but the former in not having passed entirely beyond sensuous imagery. It is true that we saw reason to believe that Plotinus' analysis of *Noûs* was not wholly in accordance with his experience on the latter point, but even so it is surely hard to accept that his language implies nothing more mysterious than what Blofeld is talking about. What is less clear is where the Buddhists stand on the question, with their enigmatic reference to "Pure Forms." Fortunately the Buddhist scheme itself provides an easy answer for, since that scheme recognizes four (or sometimes five) divisions of the Form World,<sup>100</sup> it is a natural inference that Blofeld is describing one of the lower levels and Plotinus one of the higher ones.

Once again, however, it becomes clear that only by having the experience for ourselves will we achieve full certainty on the point. I hope, however, that the above account has, first of all,

demonstrated that Plotinus' Intelligible world is beyond doubt empirically based (at least in part) and, secondly, done something, by assembling a deliberately restricted number of parallel passages, towards clarifying that experience. Once again I must stress that this paper is only a preliminary attempt to illuminate some of the territory lying between our normal consciousness and full mystical experience. If it prompts others to seek further and more fully, it will have achieved its purpose.

## NOTES

1. Cf. especially E. Bréhier, *The Philosophy of Plotinus*, pp. 182 ff. and his notices to his Budé edition (especially that to Enn. V. 1); also P. O. Kristeller, *Der Begriff der Seele in der Ethik des Plotin* (Tübingen 1929), H.-R. Schwyzer *Die Zweifache Sicht in der Philosophie Plotins* (Museum Helveticum I. 1944, pp. 87-99) and the first chapter of my *Neoplatonism* (London 1972). While recent studies have shown that Plotinus' "metaphysical" and "experiential" sides should not be separated too sharply, it is still helpful to distinguish these two aspects of his thought.
2. Termed by Aquinas discursiveness "secundum causalitatem" (*Summa Theol.* Ia. 14.7). Discursiveness of this type is denied to divine souls in e.g. Enn. IV. 3. 18, IV. 4. 12, etc.
3. Termed by Aquinas (*Summa Theol.* *ibid.*) discursiveness "per successionem tantum"; affirmed (apparently) of all souls in III. 7. 11, V. 1. 4. 10-25, denied of divine souls in IV. 4. 15-16.
4. III. 7. 11. 44: *ψυχῆς ἐν κινήσει μεταβατικῇ ἐξ ἄλλου εἰς ἄλλον βίον ζώην*.
5. Cf. W. T. Stace *The Teachings of the Mystics* (New York 1960) and *Mysticism and Philosophy* (London 1961) *passim*.
6. *Neoplatonism* p. 3.
7. For the terms cf. R. C. Zaehner, *Mysticism Sacred and Profane* (Oxford 1957). That only a difference of interpre-

- tation, not of actual experience, is involved is argued against Zaehner by Stace, whose view is endorsed by Dodds, *Pagan and Christian in an Age of Anxiety* p. 90. That Plotinus' mysticism is theistic is argued by Rist, *Plotinus, the Road to Reality*, ch. 16, pp. 213-30 and by Armstrong, *Cambridge History of Later Greek and Early Medieval Philosophy* p. 263. On the other side, see the paper of Prof. Mamo in the present volume; also my remarks in *Neoplatonism* pp. 89-90 and the (apparently conflicting) statements of Dodds at *Les Sources de Plotin* (Vandoeuvres - Geneva 1957) p. 22n. 2 and *Pagan and Christian* pp. 88-90.
8. Obvious examples from theistic mystics include Gregory of Nyssa, Pseudo-Dionysius and St. John of the Cross; from non-theistic mysticism cf. e.g. the Buddhist experiences described below pp. 136-37.
  9. On extrovertive mysticism cf. Stace, *Teachings of the Mystics* pp. 62 ff. The experience is termed "the Mysticism of Unifying Vision" by Otto, *Mysticism East and West* pp. 38 ff.; Zaehner's term (*Mysticism Sacred and Profane* p. 28) is "panenhenic."
  10. *Op. cit.* pp. 41-7, followed by Stace, *Mysticism and Philosophy* p. 77. For the correct view cf. Dodds, *Pagan and Christian* pp. 83-4; Rist, *Plotinus, the Road to Reality* pp. 215-16.
  11. *Op. cit.* p. 42.
  12. Cf. V. 8. 11. 10-12: δραμῶν δὲ εἰς τὸ εἶσω ἔχει πᾶν, καὶ ἀφ' αὐτοῦ τὴν αἰσθησιν εἰς τοῦπίσω τοῦ ἑτεροῦ εἶναι φόβῳ εἰς ἑστὶν ἐκεῖ.
  13. The best account is that of Armstrong, *Sources de Plotin* pp. 393-413, with the subsequent discussion; cf. also recently the relevant sections of P. Merlan's account of Plotinus' background in the *Cambridge History of Later Greek and Early Medieval Philosophy* pp. 13-132, with the references given there.
  14. *Pagan and Christian* p. 84 n. 1.
  15. MacKenna's translation (as is also the case with the following passages). The passage is quoted by Armstrong, *Cambridge History* pp. 245-46.

16. Quoted by Armstrong *ibid.* p. 221.
17. VI. 7. 15. 30-2.
18. V. 8. 10. 31-43.
19. Cf. the discussion at *Sources de Plotin* p. 338 of this passage and VI. 4. 7. 23-40; also Dodds, *Pagan and Christian* pp. 86-7 and my *Neoplatonism* p. 42.
20. Cf. e.g. V. 1. 4. 1-25 and the other passages listed at *Neoplatonism* p. 53n. 2. For the difficulties in Noûs's alleged "timelessness" cf. Armstrong, *Le Néoplatonisme* (Paris 1971) pp. 67-76.
21. Cf. e.g. I. 8. 2. 7-21, III. 8. 8. 1-30, V. 3. 1-9, V. 5. 1-2.
22. That the divine Noûs transcends change is argued at Met. Λ. 9. 1074b 26-7; for the interdependence of change and time cf. the definition of time at Phys. IV. 11. 220a 24-5 (Cf. also *ibid.* IV. 12. 221b 3-7 and the puzzling chapter De Caelo I. 9.). On the identity between subject and object in Noûs cf. Met. *ibid.* 1074b 33-1075a 5, De An. III. 4. 429b 22-430a 9.
23. That Noûs cannot contemplate mere images is argued in V. 5. 1-2. For the comparison of φαντασία, on which our soul's consciousness rests, to a mirror cf. I. 4. 10. 6 ff., IV. 3. 30. 7 ff. The contrast between the two Hypostases is most concisely summarized at VI. 5. 7. 3-4: νοοῦμεν ἐκεῖνα οὐκ εἰδῶλα αὐτῶν οὐδὲ τύπους ἔχοντες. εἰ δὲ μὴ τοῦτο, ὄντες ἐκεῖνα.
24. For verbal formulae as the objects of φαντασία cf. IV. 3. 30. 5 ff. That Noûs does not contemplate προτάσεις, ἀξιιώματα or λεκτά is argued at V. 5. 1. 38-9.
25. V. 8. 4. 9-11, on which cf. Armstrong, *Cambridge History* p. 245.
26. Cf. especially Festugière's discussion in *La Révélation d'Hermès Trismégiste*, Vol. IV, *Le Dieu Inconnu et la Gnose* pp. 92-140. On the absurdities resulting from this linguistic confusion cf. p. 139 of Festugière's work.
27. "Noûs, νοεῖν and their derivatives in Homer" (*Classical Philology* 38 (1943) pp. 79-83; "Noûs, νοεῖν and their derivatives in Presocratic Philosophy" (*ibid.* 40 (1945) pp. 223-242, 41 (1946) pp. 12-34). Cf. also the summary in W. K. C. Guthrie *A History of Greek Philosophy* Vol. II pp. 17-19.

28. CP 1943 p. 90.
29. CP 1945 p. 242.
30. CP 1943 p. 90.
31. *Ibid.* p. 91, quoted by Guthrie *op. cit.* p. 18n. 1.
32. CP 1943 p. 85.
33. *Ibid.* p. 89.
34. London 1964.
35. J. Hadamard, *An Essay on the psychology of invention in the mathematical field* (Princeton 1945).
36. On Pythagoras cf. *op. cit.* pp. 111-12, on Archimedes *ibid.* pp. 105-8.
37. Quoted by Stace, *Mysticism and Philosophy* p. 82.
38. The most serious detailed attack on the Letter's authenticity in recent times is that of L. Edelstein, *Plato's Seventh Letter* (Leiden 1966); cf. also G. Ryle, *Plato's Progress* (Cambridge 1966). That the Letter's philosophy is substantially Platonic is argued by Von Fritz in *Phronesis* XI, 2(1966), pp. 117-153, with whose conclusions I am in substantial agreement, though they need supplementing on certain points. Von Fritz's remarks on pp. 134-5 of the article in question are for me the strongest argument in favour of the view that the Letter is in fact Plato's. On the historical side cf. now Von Fritz's *Platon in Sizilien* (Berlin 1968) ch. I (pp. 5-62).
39. ῥητὸν γὰρ οὐδαμῶς ἐστὶν ὡς ἄλλα μαθήματα, ἀλλ' ἐκ πολλῆς συνουσίας γιγνομένης περὶ τὸ πρᾶγμα αὐτὸ καὶ τοῦ συζῆν ἐξαίφνης, οἷον ἀπὸ πυρὸς πηδῆσαντος ἐξαερθὲν φῶς, ἐν τῇ ψυχῇ γενόμενον αὐτὸ ἑαυτὸ ἤδη τρέφει.
40. More strictly the terminology at 342 D (τούτων δὲ ἐγγύτατα μὲν συγγενεία καὶ ὁμοιότητι τοῦ πέμπτου νοῦς πεπλησίακεν) would suggest that *all* human knowledge is there condemned as inadequate, whereas a distinction is subsequently made between two forms of knowledge, of which the higher (at 344B termed φρόνησις . . . καὶ νοῦς) is at least more adequate than the lower. It is also unclear whether the statement of 342 D means (a) that knowledge in general approaches closer to the nature of the Forms than the first "three" or (b) that νοῦς is closer to the Forms than other kinds of knowledge; the latter is the view of Morrow (*Plato: Epistles* p. 73.).

41. The terms εἶδος and ἰδέα are not used in the Letter, but it is clear that this is what is meant by such phrases as ὁ δὴ γνωστόν τε καὶ ἀληθῶς ἐστὶν ὄν (342B).
42. 342E: οὐ γὰρ ἂν τούτων μὴ τις τὰ τέτταρα λάβῃ ἁμῶς γέ πως, οὐποτε τελέως ἐπιστήμης τοῦ πέμπτου μέτοχος ἐσται.
43. 343E: ἡ δὲ διὰ πάντων αὐτῶν διαγωγὴ, ἄνω καὶ κάτω μεταβαίνουσα ἐφ' ἑκάστον, μόγις ἐπιστήμην ἐνέτεκεν εὖ πεφυκότες εὖ πεφυκότες.
44. 344B: μόγις δὲ τριβόμενα πρὸς ἄλληλα αὐτῶν ἕκαστα, ὀνόματα καὶ λόγοι ὅψεις τε καὶ αἰσθήσεις . . . ἐξέλαμψε φρόνησις περὶ ἑκάστον καὶ νοῦς.
45. For the parallel fluctuations in Plato's technical terminology cf. Rep. 533E-534A, where νόησις (which at 511D-E had denoted the higher form of knowledge) becomes the term for knowledge as a whole, while ἐπιστήμη (formerly the more general term) is now applied to what had previously been called νόησις. For 342C's failure to distinguish knowledge and true opinion cf. Phil. 60D and 66B-C.
46. While Adam's view, in his edition of the Republic, that the objects of διάνοια are the intermediate "mathematics" has not found general acceptance, other scholars have been sufficiently impressed by Rep. 477C-D's claim that different faculties have different objects to incline to see them as concerned with different kinds of Forms; cf. e.g. Ross, *Plato's Theory of Ideas* pp. 64-5. On the other side cf. Cross and Woodley, *Plato's Republic: a Philosophical Commentary* pp. 237-8, with whose conclusions I am in general agreement.
47. 511D: καίτοι νοητῶν ὄντων μετὰ ἀρχῆς.
48. Reference should also be made to 510D's mention of the "square itself" and "the diagonal itself", which strongly suggest that it is the mathematical Forms (and perhaps other Forms as well), rather than the "intermediates", that are the objects of διάνοια.
49. Reference is also made, however, at 431B-C, to the combination of words in propositions (λόγοι) as fulfilling a similar function. For the doctrine of the "verbal image" cf. also Phaedo 99D-100A. Among later Platonists cf. esp.

Plutarch Gen. Socr. 589B, Proclus Th. Pl. I. 10, (p. 46,2-5 Saffrey – Westerink), I. 29 (p. 124. 7-22 *ibid.*) and many passages of his *Cratylus* commentary. The doctrine is a clear anticipation of Wittgenstein's early "picture" theory of language.

50. 439C ff.; cf. N. Gulley, *Plato's Theory of Knowledge*, pp. 68-9.
51. This conclusion would not, of course, hold for anyone who regards the *Cratylus* as dating either (a) from a time before the Forms had achieved full transcendence for Plato or (b), with Owen, from a time when he was preparing to abandon the theory. Against the former view cf. Hackforth, *Plato's Phaedo* p. 9; against the latter cf. most recently N. H. Reed, "Plato on Flux, Perception and Language" (*Proc. Cambridge Philol. Soc.* 198 (n.s. 18), 1972, pp. 65-77).
52. 439B: ὄντως μὲν τοῖνυν τρόπον δεῖ μανθάνειν ἢ εὐρίσκειν τὰ ὄντα μεῖζον ἴσως ἐστὶν ἐγνωκέναι ἢ κατ' ἐμὲ καὶ σέ.
53. Cf. especially the language of the latter passage: οὐκέτ' . . . οἷος τ' ἔσει ἀκολουθεῖν · ἐπεὶ τὸ γ' ἐμὸν οὐδὲν ἂν προθυμίας ἀπολίποι οὐδ' εἰκόνα ἂν ἔτι οὐ λέγομεν ἴδοις, ἀλλ' αὐτὸ τὸ ἀληθές, δ' γε δὴ μοι φαίνεται — εἰ δ' ὄντως ἢ μὴ οὐκετ' ἀξιον τοῦτο διῃσχυρίζεσθαι · ἀλλ' ὅτι μὲν δὴ τοιοῦτον τι ἰδεῖν ἰσχυριστέον.
54. Cf. Ross, *op. cit.* pp. 54-5. Cross and Woosley, *op. cit.* pp. 241-2, Gulley, *op. cit.* p. 69.
55. Gulley's view (*op. cit.* p. 69) that the *Cratylus* is merely protesting against inadequacies in *existing* language (a view which Edelstein actually uses to distinguish its doctrine from that of the Letter and thus argue that the latter cannot be Plato's — cf. *op. cit.* p. 104 n. 76) ignores the fact that for Plato an image can *never* fully reproduce the nature of its original and that verbal images must thus always remain to some extent inadequate: cf. *Crat.* 432B: τοῦ δὲ ποιῶντος καὶ ξυμπάσης εἰκόνης μὴ οὐχ αὐτῇ ἢ ἡ ὁρθότης, ἀλλὰ τὸ ἐναντίον οὐδὲ τὸ παράπαν δέη πάντα ἀποδοῦναι οἷον ἐστὼ ὧς εἰκάζει, εἰ μέλλει εἰκὼν εἶναι.
56. Symp. 210E, Ep. VII. 341C-D.
57. For the metaphor applied to union with ultimate Truth,

cf. Rep. 490A, Symp. 212A; to sense-perception Theaet. 156A ff., etc., Soph. 248A; Cf. further Cornford, *Plato's Theory of Knowledge* pp. 239n. 1, 246.

58. Cf. above n. (13).
59. Cf. the passages listed above n. (22).
60. De An. III. 2. 425b 12 ff.
61. On this point cf. esp. the discussion in De An. III. 8.
62. Cf. above p. 125 and the passages quoted in n. (23).
63. Cf. Psellus Schol. in Joh. Clim. (=CMAG. VI. 171. 10-18, a continuation of *περὶ Φιλ.* fr. 15 Ross) and Cicero Tusc. I. 27. 66 (which inclines, however, to set limits to the soul's self-awareness). If these passages are in fact based on Aristotle's early teaching, the implications for the origin of the νοήσεως νόησις doctrine would be far-reaching; for scholars' views on the question cf. the discussion in Untersteiner's edition of the *περὶ Φιλοσοφίας*.
64. This is proved by *περὶ Φιλ.* fr. 15 Ross and Eud. fr. 10 Ross (= Plutarch De. Is. 382D-E); cf. especially the claim in the former passage that intuition occurs αὐτοῦ παθόντος τοῦ νοῦ τὴν ἑλλαμψω and is thus comparable to illumination in the Mysteries; (I therefore dissent from Dörrie's interpretation of the passage as abandoning Plato's analogy between philosophy and the Mysteries, a view presented in *Akad. des Wissensch. und der Liter., Abhandl. der Geistes- und sozialwiss. Kl.*, Wiesbaden 1956, 5 pp. 32-4).
65. Cf. esp. Post. An. II. 19, E. N. VI. 6-11.
66. E. N. VI. 6. 1140b 30 ff., Post. An. II. 19. 100b 5-17. On the nature of the ἀρχαί in question cf. Post. An. I. 10, Ross, *Aristotle* p. 55, *Prior and Posterior Analytics* pp. 55-9.
67. De An. III. 6. 430a 26 ff., Met. θ. 10. 1051b 17 ff. We may note that, whereas for Koestler scientific discovery depends on "bisociative thinking," for Aristotle such thinking, involving as it does a combination of concepts, is always the work of διάνοια. It seems evident that a satisfactory theory of intuition must find some way of mediating between the two views.

68. Cf. E. N. VI. 11. 1143a-b, a doctrine which appears in a different light, however, when we recall the Eudemian Ethics' claim that the practical man's success depends on divine inspiration (E. E. VIII. 2. 1248a 29 ff.).
69. For Festugière cf. the discussion referred to above n. (26); for Dodds cf. *Pagan and Christian* chs. 2 and 3.
70. Cf. e.g. Albinus' claim that intuition works *περιλήψει τινα καὶ οὐ διεξόδω* (Epit. IV. 6) From an earlier period we should probably place the claim of Theophrastus' metaphysical fragment (VIII. 25) that the radiance of τὰ ἄκρα καὶ πρῶτα permits them to be apprehended only by an intuitive contact (αὐτῷ τῷ νῷ . . . . . θίγοντι καὶ οἶον ἀψαμένῳ) in this class; (on the fragment cf. Merlan, *Cambridge History* p. 108).
71. Cf. esp. C. H. X. 5-6 and (more doubtfully) Numenius fr. 11 (on which cf. Dodds, *Sources de Plotin* pp. 16-17, 22-23, with the earlier discussions mentioned there), *Pagan and Christian* pp. 93-4.
72. For experiences of these types cf. Dodds, *Pagan and Christian* pp. 70-83.
73. We may note, however, from the post-Plotinian period, Marinus' claim that Proclus αὐτόπτης ἐγένετο τῶν ἐκεῖ μακαρίων ὄντως θεαμάτων, οὐκ ἔτι μὲν διεξοδικῶς καὶ ἀποδεικτικῶς συλλογιζόμενος αὐτῶν τὴν ἐπιστήμην, ὥσπερ δὲ ὄψει, ἀπλαῖς ἐπιβολαῖς τῆς νοερᾶς ἐνεργείας θεώμενος, τὰ ἐν τῷ θεῷ νῷ παραδείγματα (V. Pr. 22).
74. *Op. cit.* 35: ἐπιφομένων καὶ σπειρομένων ἄνωθεν ἀφανῶς τῶν ἐνθυμημάτων.
75. *Ibid.*: ἐρμηνείαν, εὐρεσίαν, φωτὸς ἀπόλαυσιν, ὀξυδερκεστάτην ὄψιν, ἐνέργειαν τῶν πραγμάτων ἁριδηλοτάτην, οἷα γένοιτ' ἂν δι' ὀφθαλμῶν ἐκ σαφεινότητος δείξεως. Text and translation are those of the Loeb edition.
76. *Ibid.*: ὡς ὑπὸ κατοχῆς ἐνθέου κορυβαντιᾶν καὶ πάντα ἀγνοεῖν, τὸν τόπον, τοὺς παρόντας, ἑμαυτὸν, τὰ λεγόμενα, τὰ γραφόμενα.
77. *Ibid.* 32: καλεῖται δ' ἡ φορὰ τῶν αὐτοματιζομένων ἀγαθῶν ἀφροσύνη, ἐπειδήπερ ὁ νοῦς ἀφρεῖται τῶν κατὰ τὰς ιδίας ἐπιβολὰς ἐνεργειῶν καὶ ὥσπερ τῶν ἐκουσίων

- ἡλευθέρωται διὰ τὴν πληθύν τῶν ὑομένων καὶ ἀδιαστάτως ἐπομβρούντων.
78. *Ibid.* 31: τότε μελέται μὲν καὶ πόνοι καὶ ἀσκήσεις ἡσυχάζουσιν, ἀναδίδονται δὲ ἄνευ τέχνης φύσεως προμηθεῖα πάντα ἀνθρώδῃ παῶν ὠφέλιμα.
79. *Ibid.* 33: ἔστι δὲ ταῦτα θαυμασιώτατα φύσει καὶ περικαλλέστατα· ὧν μὲν γὰρ ἂν ὠδίνῃ δι' ἑαυτῆς ἡ ψυχὴ, τὰ πολλὰ ἀμβλωθρίδια, ἡλιτόμηνα. ὅσα δὲ ἂν ἐπιφύων ὁ θεὸς ἄρδῃ, τέλεια καὶ ὁλόκληρα καὶ πάντων ἄριστα γεινῶνται.
80. Cf. above p. 127.
81. On the passage cf. especially H.-R. Schwyzer, *Sources de Plotin* pp. 370-1 and my *Neoplatonism* p. 81.
82. *Plato* I. p. 219.
83. *World as Will and Idea* (tr. Haldane and Kemp) I. p. 231.
84. On the latter point cf. especially the passage just quoted with Enn. IV. 4.2. 3-8. πρὸς δὲ ταῦτά τις ἀναμνησθήτα ὡς ὅταν καὶ ἐνταῦθα θεωρῇ καὶ μάλιστα ἐναργῶς, οὐκ ἐπιτρέφει πρὸς ἑαυτὸν τότε τῇ νοήσει, ἀλλ' ἔχει μὲν ἑαυτὸν, ἡ δὲ ἐνέργεια πρὸς ἐκεῖνο, κάκεῖνο γίνεται οἶον ὕλην ἑαυτὸν παρασχών. εἰδοποιούμενος δὲ κατὰ τὸ ὁρώμενον καὶ δυνάμει ὧν τότε αὐτός.
85. III. 7. 11. 15-16, IV. 4. 3. 1-2, V. 1. 1. 1-5.
86. For Plotinus cf. esp. I. 3. 6. 16-17, VI. 7. 36. 6-10; for Plato Rep. 518-9, Ep. VII. 344A.
87. On the need to abandon memory cf. IV. 3. 32 - IV. 4.2; on the interdependence of awareness and interest IV. 4.3. 6-8, 25. 1-11.
88. *World as Will and Idea* I. p. 234.
89. *The Psychological Attitude of Early Buddhist Philosophy* pp. 81-2.
90. More strictly, the Form world is divided into four (or sometimes five) levels, of which only the upper three have fully transcended discursive thought; cf. Govinda *op. cit.* pp. 84-5.
91. Cf. e.g. Paravahera Vajirañāna Mahāthera, *Buddhist Meditation in Theory and Practice* (Colombo 1962) p. 46: "In this stage of Samadhi the mind and its object of concentration are identical." I have not, unfortunately,

been able to trace the authority for such statements in the original Buddhist texts.

92. There is, of course, an obvious parallel here to Aristotle's early view (*περὶ Φιλ.* fr. 24) that the celestial gods have only the two higher senses (on which cf. R. Walzer in I. Düring and G. E. L. Owen, *Aristotle and Plato in the Mid-fourth Century*, pp. 105-12). Once again, one would like to know more about Aristotle's views, and their sources, during this period.
93. Another obvious parallel to the Plotinian Hypostases, which, for lack of detailed evidence, I have not pursued further here, is the Mahayana Buddhist doctrine of the Three Bodies of the Buddha; for a preliminary comparison cf. J. Przyluski, *Les Trois Hypostases dans l'Inde et à Alexandrie* (Ann. de l'Inst. de Philol. Orientale (Brussels) 4 (1936) ("Mélanges Cumont") pp. 925-33. Plotinus' account of the Intelligible world has also a strong resemblance, at least superficially, to the doctrine of the Mahayana Buddhist Gandavyuha Sutra, notably in its stress on the radiance of the Ideal world and the mutual interpenetration of its members. How close the resemblance really is, however, can hardly be determined without a complete translation of the Sutra; cf. in the meantime D. T. Suzuki's discussion in his *Essays in Zen Buddhism: Third Series*, reprinted in *On Indian Mahayana Buddhism* ed. E. Conze (London and New York 1968) pp. 147-226. It must also remain undecided, in the light of our present evidence, how far such resemblances are due to similarity of experience and how far to borrowing by one system from another. The former seems to me certainly the explanation of the resemblances noted in the text; but with regard to those mentioned in the present footnote, borrowing by one side or the other seems to me by no means impossible.
94. W. Braden, *The Private Sea: LSD and the Search for God* (Chicago 1967) pp. 238-9.
95. Cf. the reference to Plotinus at op. cit. p. 76.
96. Cf. V. 8.4.1, III. 2.1. 30 ff., II. 9. 13. 8 (the last passage actually referring to the celestial gods) and the passages

quoted by Hadot, *Plotin ou la Simplicité du Regard* pp. 132-5.

97. *Psychedelie Review* 7(1966) pp. 29-30.
98. Clearly not "undifferentiated" in Stace's sense; cf. above p. 122 and no. (5).
99. M. R. Westcott, *Towards a Contemporary Psychology of Intuition* (New York 1968) pp. 76-7.
100. Cf. above n. (90).

## Philological Comments on the Neoplatonic Notion of Infinity

JOHN WHITTAKER

MEMORIAL UNIVERSITY OF NEWFOUNDLAND

As F. R. Dodds has shown,<sup>1</sup> Plotinus' conception of the One as *ἄπειρον* derives, terminologically at least, from the First Hypothesis of Plato's *Parmenides*. But in regard to content Plotinus' claim that the One is *ἄπειρον* . . . οὐ τῷ ἀδιεξίτητῳ ἢ τοῦ μεγέθους ἢ τοῦ ἀριθμοῦ, ἀλλὰ τῷ ἀπεριλήπτῳ τῆς δυνάμεως<sup>2</sup> seems to find no support in the *Parmenides* where the conclusion that the One is *ἄπειρον* is based solely on the claim that, in order to be One, it must have no parts and therefore neither a beginning nor an end: the One is *ἄπειρον* because it has no *πέρατα*, i.e. no *ἀρχή* and no *τελευτή* (*Parm.* 137 D 4 ff.) In a valuable discussion of the matter H. J. Krämer has attempted<sup>3</sup> to trace the doctrine of the dynamic infinity of the One back to the Old Academy. But although Krämer is able to point to *Republic* 509 B where the "*ἀγαθόν* = *ἐν*" is defined as *ἐπέκεινα τῆς οὐσίας πρεσβεία καὶ δυνάμει ὑπερέχον*,<sup>4</sup> he is forced to conclude with regard to the Old Academic background of the doctrine that "Bei der Dürftigkeit und der mangelhaften Präzision der Belege empfiehlt es sich indessen, die Entscheidung vorläufig offenzuhalten."<sup>5</sup> In spite of much patient research the ancestry of the Neoplatonic doctrine, not merely in its dynamic aspect but in general, is still far from clarified.

One aspect of the problem which has not, I think, been hitherto noticed concerns the meaning of the term *ἄπειρος*. The usual connotation is that to which Plotinus referred first in the passage quoted at the outset, i.e. that of being *ἀδιεξίτητος* in

one respect or another. There is, however, a further and precisely opposite meaning of the term which finds no mention in Liddel and Scott nor in Lampe's *Patristic Greek Lexicon*, but which is especially relevant to any qualification of the One as *ἄπειρον*. In the course of a passage fraught with significance for the history of ideas Clement of Alexandria writes (*Strom.* V. 12. 81. 5 f.) *πῶς γὰρ ἂν εἴη ῥητὸν [sc. Θεός] ὃ μήτε γένος ἐστὶ μήτε διαφορὰ μήτε εἶδος μήτε ἄτομον μήτε ἀριθμός, ἀλλὰ μηδὲ συμβεβηκός τι μηδὲ ὧ συμβέβηκέν τι. οὐκ ἂν δὲ ὅλον εἴποι τις αὐτὸν ὀρθῶς· ἐπὶ μεγέθει γὰρ τάττεται τὸ ὅλον καὶ ἔστι τῶν ὅλων πατήρ. οὐδὲ μὴν μέρη τινὰ αὐτοῦ λεκτέον· ἀδιαίρετον γὰρ τὸ ἔν, διὰ τοῦτο δὲ καὶ ἄπειρον, οὐ κατὰ τὸ ἀδιεξίτητον νοούμενον, ἀλλὰ κατὰ τὸ ἀδιάστατον καὶ μὴ ἔχον πέρας, καὶ τοίνυν ἀσχημάτιστον καὶ ἄνωμόμαστον.* The term *ἄπειρος*, says Clement in effect, is applicable not only to that which is infinite in extent (*ἀδιεξίτητον*), but also to that which is infinitely small (*ἀδιάστατον*).<sup>6</sup> That this conception of the infinite is not simply a product of Clement's own cogitations and therefore peculiar to himself is evident from a consideration of a passage in Plutarch's *Cons. ad Ap.*, in which, commenting upon the indifference of whether a human life be long or short, Plutarch writes (111 C): *τό τε πολὺ δῆπουθεν ἢ μικρὸν οὐδὲν διαφέρειν δοκεῖ πρὸς τὸν ἄπειρον ἀφορώσω αἰῶνα. τὰ γὰρ χίλια καὶ τὰ μύρια κατὰ Σιμωνίδην (fr. 648 Page) ἔτη στιγμή τις ἐστὶν ἀόριστος, μᾶλλον δὲ μόριόν τι βραχύτατον στιγμῆς.*<sup>7</sup> Thus, like *ἄπειρος*, the term *ἀόριστος* can be applied not only to that which is too large to admit of definition but also to that which is too small. Once again there is no reference in Liddel and Scott nor in the *Patristic Greek Lexicon* under *ἀόριστος* or its cognates to this somewhat unusual conception of the indefinite.<sup>8</sup>

But though unusual, there is nothing "non-Greek" about the conception: already Anaxagoras was familiar with the notion of the infinitely small (fr. 1 Diels-Kranz): *δομοῦ πάντα χρήματα ἦν, ἄπειρα καὶ πλῆθος καὶ σμικρότητα· καὶ γὰρ τὸ σμικρὸν ἄπειρον ἦν.* Moreover, Clement's characterization of the One as *ἄπειρον* seems to coincide precisely with that of the First Hypothesis of the *Parmenides*. According to Plato, as we have seen, the One is *ἄπειρον* because it has no parts and in

consequence no *πέρατα*. Similarly Clement claims that, since it is indivisible and has no parts, the One is *ἄπειρον*, not indeed in extent but *κατὰ τὸ ἀδιάστατον καὶ μὴ ἔχον πέρας*. However, the similarity between Clement's argumentation and that of the First Hypothesis does not end here. Both Clement in the passage quoted above and Plato (*Parm.* 137 C 4 - D 8) argue (1) that the One is not a whole (*ὅλον*), (2) that the One cannot be spoken of as having parts (*μέρη*), (3) that the One is infinite (*ἄπειρον*), and (4) that the One has no form (*ἄνευ σχήματος* Plato; *ἀσχημάτιστον* Clement). At this point Plato goes on to list further limitations (the One is neither round nor straight, etc.) which Clement (or perhaps his source) has omitted, presumably because they were not considered theologically relevant. But the next characteristic which Clement assigns to the One - that of being nameless (*ἄνωμόμαστον*) - appears at the close of the First Hypothesis (142 A 3): *Οὐδ' ἄρα ὄνομα ἔστω αὐτῷ . . .* Though this is noted neither in Stählin's *Index fontium* nor in L. Früchtel's *Nachträge*, there can be no question but that Clement's presentation is dependent ultimately upon the First Hypothesis of the *Parmenides*. However, one may go further than this. That Clement's negative theological utilization of the First Hypothesis derives from, or is at least influenced by, a Middle Platonic commentary or adaptation is evident from a consideration of a parallel passage in the *Didaskalikos*, to which Früchtel drew attention, but without noting that both authors were dependent, through an intermediate source, upon the *Parmenides*.<sup>9</sup>

*ἄρρητος δ' ἔστι καὶ νῶ*

- 5 *μόνῳ ληπτὸς, ὡς εἴρηται. ἐπεὶ οὔτε γένος ἐστὶν οὔτε εἶδος οὔτε διαφορὰ, ἀλλ' οὐδὲ συμβέβηκε τι αὐτῷ, οὔτε κακόν· οὐ γὰρ θέμις τοῦτο εἰπεῖν· οὔτε ἀγαθόν· κατὰ μετοχὴν γὰρ τινος ἔσται οὕτως καὶ μάλιστα ἀγαθότητος· οὔτε ἀδιαφορον· οὐδὲ γὰρ τοῦτο κατὰ τὴν ἐννοίαν αὐτοῦ· οὔτε ποιόν· οὐ γὰρ ποιωθέν ἐστι καὶ*  
 10 *ὑπὸ ποιότητος τοιοῦτον ἀποτελεσμένον· οὔτε ἄποιον· οὐ γὰρ ἐστέρηται τινος ἐπιβάλλοντος αὐτῷ ποιού· οὔτε μέρος τινός, οὔτε ὡς ὅλον ἔχον τινὰ μέρη, οὔτε ὥστε ταῦτόν τι εἶναι ἢ ἕτερον· οὐδὲν γὰρ αὐτῷ συμβέβηκε καθ' ὃ δύναται τῶν ἄλλων χωρισθῆναι· οὔτε κινεῖ οὔτε κινεῖται.*

*Didask.* p. 165.4 ff. Hermann (In line 8 H, οὕτως is my suggestion for the οὗτος of the mss., whilst ἀδιάφορον is Festugière's conjecture in place of the impossible mss. reading διαφορά. The phrase οὔτε διαφορά is omitted at this point, perhaps intentionally, in *Marcianus gr.* 513 and *Laurentianus* 71. 33. In line 12 ταῦτόν τι is the correct reading not only because it conforms with *Parm.* 139 B 4 ff., but also because it is attested by *Parisinus gr.* 1962, *Vindobonensis phil. gr.* 314 and the mainstream of the mss. tradition. Hermann had been misled by *Parisinus gr.* 1309 into reading ταῦτόν τι (though in fact this latter aberrant reading also occurs in five further mss. which Hermann did not consult). In the final line the phrase οὔτε κινεῖται οὔτε κινεῖται constitutes, since the immobility of the supreme deity was one of the presuppositions of Middle Platonic speculation, a not unimportant revision of the argument of *Parm.* 139 B 3 that οὔτε ἔστηκεν οὔτε κινεῖται. Numenius (fr. 24 Leemans) declares, perhaps with the *Parmenides* in mind, that though the First God is ἑστώς he may be said to have a κίνησις σύμφυτος, namely στάσις. Plotinus does not hesitate to follow the *Parmenides* the whole way in arguing that the One is (*Enn.* VI. 9. 3. 42 f.) οὐδὲ κινούμενον οὐδ' αὖ ἑστώς).

Since the resemblances between the above passage of the *Didaskalikos* and that of Clement extend beyond their mutual dependence upon the *Parmenides* we are forced to conclude either that both are dependent upon the same intermediate source, or that Clement was drawing upon the *Didaskalikos*. This latter possibility is, however, excluded by the fact that Clement's presentation reveals features of the First Hypothesis which are lacking from the *Didaskalikos*: i.e., the introduction of the term τὸ ἓν and the qualification of this first principle as ἄπειρον, ἀσχημάτιστον and ἀνωνόμαστον. We must therefore conclude that independently of each other Clement and the author of the *Didaskalikos* have drawn from a theologically inclined Middle Platonic Commentary upon the *Parmenides*, or at least from a Middle Platonic theologico-metaphysical adaptation of the First Hypothesis. Thus, the Middle Platonists did not, as has been frequently supposed, regard the *Parmenides* solely as a "logical exercise-book"<sup>10</sup> without metaphysical relevance. The above passages from Clement and the *Didask-*

*alikos* provide incontestable proof of a pre-Plotinian theological interpretation of the First Hypothesis of the *Parmenides*, and they must be taken seriously into account when one weighs the value of Simplicius' report (drawn from Porphyry) of a metaphysical interpretation on Neoplatonic lines of the first three Hypotheses by the Platonist Moderatus in the first century after Christ.<sup>11</sup>

The ambiguity of the term ἄπειρος, which may be employed legitimately not only κατὰ τὸ ἀδιεξίτητον to indicate the interminable but also κατὰ τὸ ἀδιάστατον to indicate the infinitesimal, is well brought out, as we have seen, by Clement. It must be mentioned that such terminological ambivalence is not necessarily a deficiency, and in the case of ἄπειρος can well be turned to account in the service of mystical theology. The Neoplatonic conception of αἰών is a good case in point. Plotinus (*Enn.* III. 7. 11. 2 ff.) speaks of this as τὴν ἀτρεμὴν ἐκείνην καὶ ὁμοῦ πᾶσαν καὶ ἄπειρον ἥδη ζωὴν καὶ ἀκλιωτὴν πάντη καὶ ἐν ἐνὶ καὶ πρὸς ἓν ἑστῶσαν. Clearly the juxtaposition of ὁμοῦ πᾶσαν (which implies that αἰών is ἀδιάστατος, a *totum simul*)<sup>12</sup> and ἄπειρον is eased by the latent ambivalence of this latter term, in that each of the two meanings of ἄπειρον specified by Clement may be considered relevant to the doctrine in hand. For Plotinus is at pains to point out not only that αἰών is a ζωὴ ὁμοῦ πᾶσα (= ἀδιάστατος)<sup>13</sup> but also, as a long established etymology dictated,<sup>14</sup> that the term αἰών derived ἀπὸ τοῦ αἰεῖ ὄντος (*Enn.* III. 7. 4. 42 f.). We must of course beware in this and similar contexts of understanding αἰεῖ in a too literally temporal sense,<sup>15</sup> but nonetheless there remains an unavoidable and insoluble contradiction in the paradoxical identification of νῦν and αἰεῖ which is the essence of the doctrine and a principal source of its fascination. Consider, for example, Plutarch, *De E apud Delphos* 393 A εἰς ὧν ἐνὶ τῷ νῦν τὸ αἰεῖ πεπλήρωκε [sc. ὁ θεός]. Or Porphyry, *Sententiae*. p. 44. 13 ff. Mommert εἰ δὲ μὴ τότε μετὰ τότε ἐπ' αὐτοῦ γίνεται, ἅμα πάντα νοεῖ [sc. νοῦς]. ἐπεὶ οὖν πάντα ἅμα καὶ οὐ τὸ μὲν νῦν τὸ δὲ αὖτις, πάντα ἅμα νῦν καὶ αἰεῖ. εἰ οὖν ἐπ' αὐτοῦ τὸ νῦν, ἀνήρηται δὲ τὸ παρελθὺς καὶ τὸ μέλλον, ἐν ἀδιαστάτῳ τὸ νῦν (καὶ) ἀχρόνῳ παραστήματι. ὥστε τὸ ὁμοῦ κατὰ τε τὸ πλῆθος κατὰ τε τὸ χρονικὸν διάστημα ἐπ' αὐτοῦ. διὸ καθ' ἓν πάντα καὶ (ἐν) ἐνὶ καὶ ἀδιαστάτῳ καὶ ἀχρόνῳ.<sup>16</sup>

Particularly instructive with regard to the ambivalence of the term *ἄπειρος* is Boethius' account in *Cons.* V. 6 of the nature of *aeternitas*, since the discussion maintains a rigid distinction between *interminabilis* (= *ἄπειρος/ἀδιάστατος*, applicable to the eternal) and *infinitus* (= *ἄπειρος/ἀδιεξίτητος*, applicable to the temporally everlasting). Thus, after offering his familiar definition (*Aeternitas igitur est interminabilis vitae tota simul et perfecta possessio*) Boethius underlines the distinction between the eternal and the merely temporally everlasting as follows:

Quod igitur temporis patitur condicionem, licet illud, sicuti de mundo censuit Aristoteles, nec coeperit umquam esse nec desinat vitaeque eius cum temporis *infinitate* tendatur, nondum tamen tale est ut aeternum esse iure credatur. Non enim totum simul *infinitae* licet vitae spatium comprehendit atque complectitur, sed futura nondum transacta iam non habet. Quod igitur *interminabilis* vitae plenitudinem totam pariter comprehendit ac possidet, cui neque futuri quidquam absit nec praeteriti fluxerit, id aeternum esse iure perhibetur, idque necesse est et sui compos praesens sibi semper adistere et *infinitatem* mobilis temporis habere praesentem.

Only on one occasion in the course of his discussion and in order to achieve a special emphasis does Boethius permit himself to use the one term in both senses (*loc. cit.*): Aliud est enim per *interminabilem* duci vitam, quod mundo Plato tribuit, aliud *interminabilis* vitae totam pariter complexum esse praesentiam, quod divinae mentis proprium esse manifestum est. The very fact that Boethius has bothered to create and maintain this distinction between *interminabilis* and *infinitus* suggests that the ambiguity of the notion of the infinite caused him some embarrassment. As Proclus puts it (*In Tim.* I. 278. 10 f. Diehl) οὐδὲ γὰρ ἡ αὐτὴ ἀπειρία χρόνον καὶ αἰῶνος· οὐδὲ γὰρ ταῦτόν αἰὼν καὶ χρόνος. But Proclus makes no terminological distinction between the various types of *ἀπειρία*.<sup>17</sup>

More direct influence of the argument of the First Hypothesis that indivisibility into parts implies infinity is evident in Proclus' claim that unity and infinity must be regarded as correlates (*El. theol.* prop. 86, p. 78. 29 f. Dodds καὶ ὅσα δὴ μᾶλλον ἐν καὶ μᾶλλον ἡμέρες, τοσοῦτω καὶ ἄπειρον

μᾶλλον. Cf. also prop. 95 Πᾶσα δύναμις ἐνικωτέρα οὐσα τῆς πληθυνομένης ἀπειροτέρα.). Proclus is, however, not entirely consistent in the matter of the infinity of the One. *Contra Dodds*<sup>18</sup> he does not argue at *In Parm.* 1124 with regard to *αὐτοαπειρία* and *αὐτόπερας* that "τὸ αὐτόπερας is the 'higher' of the pair, as being more akin to the One." In fact in the passage in question Proclus is at pains to explain how τὸ ἄπειρον (since this is the term with which Plato qualifies the One in the First Hypothesis) is superior to τὸ πέρας; cf. *In Parm.* 1123. 30 ff. καὶ γὰρ τῷ πάντων ἀρίστῳ χρή προσφέρειν τὸ ἀόριστον, ἀλλ' οὐ τὸ ὁπωσοῦν καταδεέστερον. On this point there is nonetheless an ill-concealed ambivalence in Proclus' thought, in that he finds the terminology of the First Hypothesis in conflict with his natural preference for the finite. Thus at *Theol. Plat.* p. 133 he writes ἀπάσης τῆς ἐν τοῖς θεοῖς γένεσιν ἀντιθέσεως τὸ μὲν κρεῖττον ἐπὶ τὸ πέρας τὸ δὲ καταδεέστερον ἐπὶ τὴν ἀπειρίαν ἀνοίσομεν. However, already Plotinus (cf. *Enn.* VI. 8. 9. 42) qualifies the One as ἀόριστος. St. Basil (*Adv. Eunomium* I. 7, PG 29, 525) finds it natural to speak of God as τὸν ἀόριστον καὶ ἄπειρον, and both these terms are applied to the supreme divinity by both Gregory Nazianzen and Gregory of Nyssa.<sup>19</sup> Marius Victorinus emphasizes the ἀοριστία of the First Principle at *Adv. Arium* IV. 23. 12 ff. Henry-Hadot: Sed cum in uno omnia vel *unum omnia* aut cum *unum omnia* vel *nec unum nec omnia*, sit infinitum, sit incognitum, indiscernibile, incognoscibile, et quod vere dicitur ἀοριστία, id est infinitas et indeterminatio. And Ps.-Dionysius makes an interesting identification of ἀοριστία and ἐνότης (*De div. nom.* I. 1, PG 3. 588) ὑπέρκειται τῶν οὐσιῶν ἢ ὑπερούσιος ἀοριστία· καὶ τῶν νοῶν, ἢ ὑπὲρ νοῶν ἐνότης.<sup>20</sup>

Nicholas of Cusa took careful note of Proclus' vacillation regarding the priority of the infinite. On the guard-sheets of *Strasbourg. Bibliothèque nationale et universitaire, cod. 84 (lat. 81)* he has copied an excerpt from William of Moerbeke's rendering of Proclus, *In Parm.* corresponding to cols. 1123 f. in Cousin's edition of the Greek text, i.e. the passage to which we have just made reference.<sup>21</sup> To this Nicholas has added *inter alia* the following comment:<sup>22</sup> Arguit, quod deo non conveniat infinitum, quia *finis melior*, sed concludit, quod merito con-

venit infinitum. Quod nota! On another occasion Nicholas comments as follows in the margin of Moerbeke's version of the *In Parm.*:<sup>23</sup>

Nota et considera quomodo 'in' dicitur ut 'non' et 'valde'. Illa si simul consideras, ut unum et idem sit 'non' et 'valde', tunc subintrare poteris intellectum huius, scilicet quomodo negatio est plus quam affirmatio, ut cum deus dicitur infinitus, id est non et valde finitus. Nota: 'in' est copulatio sive unio affirmationis et negationis; sicut enim prima elementa de 'ita' et 'non', scilicet i et n in se unit, ita et utriusque significatum, et est equalitas 'non' et 'valde'. Et resolvitur sic: 'non', quod 'valde', ut infinitum dicatur sic non finitum, quod valde finitum. Sed melius sic resolvitur: non solum non finitum, sed simul et valde finitum.

Apart from the fanciful etymology of the prefix in-, the version of the *coincidentia oppositorum*<sup>24</sup> which Nicholas here offers conforms with the legitimate meanings of ἀπειρος and is not entirely out of keeping with the argument of Proclus that (*El. Theol.* prop. 93) Πᾶν τὸ ἀπειρον ἐν τοῖς οὐσιν οὔτε τοῖς ὑπερκειμένοις ἀπειρόν ἐστιν οὔτε ἑαυτῷ. Cf. also the interpretation of the ἀπειρον of the First Hypothesis which Proclus quotes with approval at *In Parm.* 1118. 10 ff. Cousin:

καὶ οἱ μὲν οὕτω φαίνειν ἀπειρον προσειρησθαι τὸ ἐν, ὡς ἀδιεξίτητον καὶ ὡς πέρας τῶν ὅλων (διχῶς γὰρ λέγεται τὸ ἀπειρον, τὸ μὲν οἶον τὸ ἀληπτον καὶ ἀδιεξίτητον, τὸ δὲ οἶον ὁ πέρας ἐστὶ τὸ μὴ ἔχον ἄλλο πέρας· καὶ τὸ ἐν οὖν ἀμφοτέρως εἶναι ἀπειρον, ὡς ἀληπτόν τε καὶ ἀπεριήγητον πᾶσι τοῖς δευτέροις, καὶ ὡς πέρας τῶν ὅλων καὶ μὴ δεόμενον αὐτὸ πέρατος ἄλλου μηδενός).

The doctrine that the Infinite is infinite not to itself but only to its inferiors lies at the close of a long development. Origen (*De princip.* II 9. 1, PG 11, 225) had argued that one must admit that God's power is limited for the following reason: ἔαν γὰρ ἡ ἀπειρος ἡ θεῖα δύναμις, ἀνάγκη αὐτὴν μηδὲ ἑαυτὴν νοεῖν· τῇ γὰρ φύσει τὸ ἀπειρον ἀπερίληπτον. πεποίηκε τοίνυν τοσαῦτα ὧν ἐδύνατο περιδράσασθαι, καὶ ἔχειν αὐτὰ ὑπὸ χειρὸς, καὶ συγκροτεῖν ὑπὸ τὴν αὐτοῦ πρόνοιαν. Whilst Alexander of Aphrodisias (cf. *De fato* 200, 12 ff. Bruns and *In Metaph.* fr. 36 Freudenthal)<sup>25</sup> claimed that since the infinite is essentially incomprehensible, God cannot possess knowledge of the infinite

details of the events of this world.<sup>26</sup> St. Augustine (*De civ. Dei* XII. 18, PG 41, col. 367 f.) attacks the views of those who hold that *nec Dei scientia quae infinita sunt posse comprehendi* in the following terms:

Infinitas itaque numeri, quamvis infinitorum numerorum nullus sit numerus, non est tamen incomprehensibilis ei cuius intellegentiae non est numerus. Quapropter si, quidquid scientia comprehenditur, scientis comprehensione finitur: profecto et omnis infinitas quodam ineffabili modo Deo finita est, quia scientiae ipsius incomprehensibilis non est. Quare si infinitas numerorum scientiae Dei, qua comprehenditur, esse non potest infinita; qui tandem nos sumus homunculi, qui eius scientiae limites figere praesumamus, dicentes quod, nisi eisdem circuitibus temporum eadem temporalia repetantur, non potest Deus cuncta quae facit vel praescire ut faciat, vel scire cum fecerit? Cuius sapientia simpliciter multiplex et uniformiter multiformis, tam incomprehensibili comprehensione omnia incomprehensibilia comprehendit, ut quaecumque nova et dissimilia consequentia praecedentibus si semper facere vellet, inordinata et improvisa habere non posset; nec ea praevideret ex proximo tempore, sed aeterna praescientia contineret.

This theme of the infinite but nonetheless unitary and indivisible nature of divine πρόνοια is pursued in almost identical terms by Proclus at, e.g., *De decem. dub.* 5. 30 ff. Boese: . . . καὶ ἡ τῆς προνοίας ἐνιαία γνώσις ἐν τῷ αὐτῷ ἀμερεῖ πάντων ἐστὶ τῶν μεριζομένων γνώσις καὶ τῶν ἀτομωτάτων ἐκάστου καὶ τῶν ὀλικωτάτων· καὶ ὡς ὑπέστησεν ἕκαστον κατὰ τὸ ἐν, οὕτως καὶ γινώσκει ἕκαστον κατὰ τὸ ἐν. καὶ οὔτε ἡ γνώσις διήρθε τοῖς γινωσκομένοις, οὔτε τὰ γινωσκόμενα συγκέχεται διὰ τὴν μίαν τῆς γνώσεως ἐνώσω· μία δὲ οὐσα, πᾶσαν μὲν ἀπειρίαν τῶν γνωστῶν περιέχει, πάσης δὲ τῆς ἐν αὐτοῖς ἐνώσεως ὑπερήνωται. Thus, the quandary that lies behind Origen's claim regarding divine providence and the incomprehensibility of the infinite, finds its solution in Proclus' considered doctrine of the identity of the infinite and the unitary: as Cusanus put it, "infinite" means *non solum non finitum, sed simul et valde finitum*.<sup>27</sup>

It is not surprising that the latent ambiguity of *ἄπειρος* appears to be utilized also in discussions of the immanence-transcendence antinomy - God is not only *πανταχοῦ* but also *οὐδαμοῦ*.<sup>28</sup> Plotinus puts the problem succinctly thus (*Enn.* VI. 4. 1. 11 ff.) *Τὸ τε ἀμερῇ λεγομένην καὶ ἀμεγέθη εἶναι πανταχοῦ εἶναι μέγεθος οὐκ ἔχουσιν πῶς ἂν τις παραδέξαιτο;* and goes on to discuss it at considerable length (*Enn.* VI. 4 and 5), emphasizing that the doctrine in question is not simply a philosopher's fancy but conforms to common opinion (*Enn.* VI. 5. 1. 1 ff.): *Τὸ ἐν καὶ ταῦτόν ἀριθμῶ πανταχοῦ ἅμα ὅλον εἶναι κοινὴ μὲν τις ἐννοιά φησιν [εἶναι], ὅταν πάντες κινοῦμενοι αὐτοφυσῶς λέγωσι τὸν ἐν ἐκάστῳ ἡμῶν θεὸν ὡς ἓνα καὶ τὸν αὐτόν.*<sup>29</sup> In the course of the discussion Plotinus dwells upon the potential identity of unity and infinity in the following terms (*Enn.* VI. 4. 14. 3 ff.): *καὶ γὰρ ἐν ἐστὶ καὶ ἄπειρον αὐ καὶ πάντα ὁμοῦ καὶ ἕκαστον ἔχει διακεκριμένον καὶ αὐτὸ οὐ διακριθὲν χωρὶς· πῶς γὰρ ἂν καὶ ἄπειρον ἢ οὕτω λέγοιτο, ὅτι ὁμοῦ πάντα ἔχει, πᾶσαν ζωὴν καὶ πᾶσαν ψυχὴν καὶ νοῦν ἅπαντα; ἕκαστον δὲ αὐτῶν οὐ πέρασιν ἀφώρισται· διὰ τοῦτο αὐτὸ καὶ ἐν. οὐ γὰρ δὴ μίαν ζωὴν ἔδει αὐτὸ ἔχειν, ἀλλ' ἄπειρον, καὶ αὐτὴ μίαν· καὶ τὴν μίαν οὕτω μίαν, ὅτι πᾶσας ὁμοῦ οὐ συμφορηθείσας εἰς ἐν. ἀλλ' ἀφ' ἐνὸς ἀρξαμένας καὶ μενούσας ὁθεν ἤρξαντο, μᾶλλον δὲ οὐδὲ ἤρξαντο, ἀλλ' οὕτως εἶχεν ἀεί.* Within the same Neoplatonic framework and probably in dependence upon Proclus, Meister Eckhart in a sermon upon the theme *Deus unus est* attempts a solution of the problem of the omnipresence of the transcendent One:<sup>30</sup> *Deus simplicitate est infinitus et infinitate sua est simplex. Ideo ei ubique est et ubique totus est. Ubique infinitate, sed totus ubique simplicitate. Deus solus illabitur omnibus entibus, ipsorum essentiis. Nihil autem aliorum illabitur alteri. Deus est in intimis cuiuslibet et solum in intimis, et ipse solus unus est.* Even though the links may be both many and tenuous, Meister Eckhart's explanation builds upon the equation of the infinite and the indivisible which Plato had made in the First Hypothesis, but which in turn possessed (as Plutarch's *στιγμὴ ἀόριστος* shows)<sup>31</sup> a basis in popular usage. We cannot suppose that Meister Eckhart himself was aware that any such basis in popular usage had ever existed. Indicative of this is the fact that in discussing the problem of God's *ubiquitas* Thomas Aquinas (*Summa*. I a. 8, 2) dwells not

upon the ambivalence of the infinite but upon a supposed ambiguity of the term *indivisible*. To the objection that God who is indivisible cannot be in all places at the same time he makes the following rejoinder:

...dicendum quod indivisibile est duplex. Unum quod est terminus continui ut punctus in permanentibus et momentum in successivis. Et huiusmodi indivisibile in permanentibus, quia habet determinatum situm, non potest esse in pluribus partibus loci vel in pluribus locis; et similiter indivisibile actionis vel motus, quia habet determinatum ordinem in motu vel actione, non potest esse in pluribus partibus temporis. Aliud autem indivisibile est quod est extra totum genus continui, et hoc modo substantiae incorporeae ut Deus et anima et substantiae separatae dicuntur esse indivisibiles. Tale igitur indivisibile non applicatur ad continuum sicut aliquid ejus sed inquantum contingit illud sua virtute. Unde secundum quod virtus sua se potest extendere ad unum vel multa, ad parvum vel magnum, secundum hoc est in uno vel pluribus locis, et in loco parvo vel magno.

Though the infinite has here been supplanted by the indivisible, it may be noted that the second of the two senses which Thomas assigns to *indivisible* conforms closely to the doctrine of Proclus (to which we have already had occasion to refer)<sup>32</sup> that *ὅσω δὴ μᾶλλον ἐν καὶ μᾶλλον ἀμερές, τοσοῦτω καὶ ἄπειρον μᾶλλον*.

We have noted that the contradictory meanings which *ἄπειρος* is capable of bearing give to the term, particularly in the instances when it is not apparent that a writer had in mind the one meaning rather than the other, a certain affinity to Cusanus' *coincidentia oppositorum*. The resemblance is hardly more than superficial, for the whole philosophy of the *coincidentia* is foreign to the negative theological tendencies of later antiquity. Thus, Martin Luther, perhaps under the influence of Cusanus, could write as follows:<sup>33</sup>

Nichts ist so klein, Gott ist noch kleiner, Nichts ist so gros, Gott ist noch grösser, Nichts ist so kurtz, Gott ist noch kürztzer, Nichts ist so lang, Gott ist noch lenger, Nichts ist so breit, Gott ist noch breiter, Nichts ist so schmal, Gott ist noch schmeler und so fort an, Ists ein unausprechlich wesen

uber und ausser allem, das man nennen odder dencken kan. But to Luther's litany the following Middle-Platonic inspired negative theology from the Gnostic *Apocryphon of John* presents a remarkable contrast:<sup>34</sup>

It is not perfection or beatitude or deity, but something far more excellent. It is not boundless nor are limits set to it; it is something far more excellent. It is neither corporeal nor incorporeal, not great, not small, not a quantity, not a creature; no one can think it. It is not anything existent, but something prior - not as if in itself it were prior, but because it is its own.

As the *Apocryphon* indicates, the Platonists of later antiquity were concerned not to assert the applicability to the first principle of both opposites, but rather to deny the applicability of both. Consider, for example, Plotinus, *Enn.* V. 3. 14. 3 ff. Πῶς οὖν λέγομεν περὶ αὐτοῦ, εἰ μὴ αὐτὸ ἔχομεν; "Ἡ, εἰ μὴ ἔχομεν τῇ γνώσει, καὶ παντελῶς οὐκ ἔχομεν; 'Ἄλλ' οὕτως ἔχομεν, ὥστε περὶ αὐτοῦ μὲν λέγειν, αὐτὸ δὲ μὴ λέγειν. Καὶ γὰρ λέγομεν, ὃ μὴ ἔστιν· ὃ δὲ ἔστιν, οὐ λέγομεν. That Plotinus is simply echoing a theological commonplace of the period is evident from, e.g., Clement of Alexandria, *Strom.* V. 11. 71. 3 εἰ τοίνυν, ἀφελόντες πάντα ὅσα πρόσεστι τοῖς σώμασιν καὶ τοῖς λεγομένοις ἁσώματοις, ἐπιρρίψαμεν ἑαυτοὺς εἰς τὸ μέγεθος τοῦ Χριστοῦ καθεῖθεν εἰς τὸ ἀχανές ἀγιότητι προίκομεν, τῇ νοήσει τοῦ παντοκράτορος ἀμὴ γέ πη προσάγομεν (ἄν), οὐχ ὃ ἔστιν, ὃ δὲ μὴ ἔστι γνωρίσαντες.<sup>35</sup> But as a purely philological explanation of the meanings of the term ἄπειρος Cusanus' postulate (*non solum non finitum, sed simul et valde finitum*) would have won the approval of Clement of Alexandria.

More pertinent to the Neoplatonic doctrine is Aristotle, *Phys.* 8. 10, where it is shown that the Unmoved Mover, though neither πεπερασμένον nor ἄπειρον (i.e., in extent) does possess δύναμις ἄπειρος and ἀδιαίρετον ἐστι καὶ ἀμερές καὶ οὐδὲν ἔχον μέγεθος (i.e., immaterial); cf. *Metaph.* 1073 a 5 ff.
5. Cf. R. Mondolfo, *L'infinito nel pensiero dell' antichità classica* (Florence 1956); A. H. Armstrong, "Plotinus's doctrine of the infinite and its significance for Christian thought," *The Downside Review* 73 (1955) 47 ff.; L. Sweeney, "Infinity in Plotinus," *Gregorianum* 38 (1957) 513 ff. and 713 ff.; W.N. Clarke, "Infinity in Plotinus: a reply," *Gregorianum* 40 (1959) 75 ff.; A. H. Armstrong and R. A. Markus, *Christian Faith and Greek Philosophy* (London 1960) Chapter 2: God's transcendence and infinity; E. Mühlenberg, *Die Unendlichkeit Gottes bei Gregor von Nyssa: Gregors Kritik am Gottesbegriff der klassischen Metaphysik* (Göttingen 1966); W. Theiler, "Das Unbestimmte, Unbegrenzte bei Plotin," *Revue Internationale de Philosophie* 92 (1970) 290 ff. There is a valuable account of the persistence and development in the medieval Cabbala of the Neoplatonic conception of infinity in G. Scholem, "Das Ringen zwischen dem biblischen Gott und dem Gott Plotins in der alten Kabbala," *Eranos-Jahrbuch* 33 (1964) 9 ff. (reprinted in Scholem's *Über einige Grundbegriffe des Judentums* (Frankfurt 1970) 9 ff.). Scholem's essay provides a necessary corrective to the brief account of infinity in the Cabbala given by E. R. Goodenough, *By Light, Light: The Mystic Gospel of Hellenistic Judaism* (New Haven 1935; rp. Amsterdam 1969) 359 ff.
6. Mühlenberg, *op. cit.* 75 ff. rightly criticizes the interpretation of this text of Clement offered by E. F. Osborn, *The Philosophy of Clement of Alexandria* (Cambridge 1957)

42. However, Mühlenberg himself is forced to underestimate the significance of Clement's words (not to mention the importance of Plotinus' contribution) in order to support his own thesis that (*op. cit.* 26): "Die negative Theologie, die Platon begründet hat, hat ein Gottesprädikat niemals aufgenommen: das Unendliche. Bei Gregor von Nyssa findet sich dieses Gottesprädikat zum ersten Male in der Geschichte des philosophischen und christlichen Denkens."
7. The conception of human life as a *στιγμή χρόνου* was a Stoic commonplace; cf. Marcus Aurelius II. 17, and the parallels thereto cited by Farquharson in his edition of the *Meditations* II (Oxford 1944) 537.
  8. *ἀπέραντος* is no doubt similarly ambiguous. Following *Laurentianus* 5. 3 it should be retained in the text of Clement at *Strom.* V. 12. 81. 3 *βυθὸν* (δ') αὐτὸν [sc. Θεὸν] *κεκλήκασιν ἐντεῦθεν τινὲς ὡς ἂν περιειληφότα καὶ ἐγκολπισάμενον τὰ πάντα ἀνέφικτόν τε καὶ ἀπέραντον*. Früchtel (*Nachträge* p. 535) proposes that one should prefer *ἀπεριωρόντων*, the reading of the pertinent extract of Clement in *Lavra* B. 113. *ἀπέραντων* is not only in keeping with *ἄπειρον* in *Strom.* V. 12. 81. 6, but also appears as a divine epithet in the *Corpus Hermeticum* (IV. 8 [I. 52. 11 f. Nock-Festugière] *ἀδιάβατον γὰρ τὸ ἀγαθὸν καὶ ἀπέραντον καὶ ἀτελές*), in the Ps.-Clementine *Homilies* (cf. Lampe's *Patristic Greek Lexicon* s.v.), and e.g. in the *Anonymous Gnostic Writing* in the *Codex Brucianus* (cf. the *Index* s.v. in GCS, *Koptisch-gnostische Schriften* I). Irenaeus at *Haer.* I. 17. 2, PG 7, 641 writes of the Marcosians that *Πρὸς δὲ τούτοις θελήσαντά φασιν τὸν Δημιουργὸν τῆς ἄνω ὁγδοάδος τὸ ἀπέραντον καὶ αἰώνιον καὶ ἄοριστον καὶ ἄχρονον μιμήσασθαι, καὶ μὴ δυνηθέντα τὸ μόνιμον αὐτῆς καὶ αἰδίων ἐκτυπῶσαι, διὰ τὸ καρπὸν εἶναι ὑστερήματος, εἰς χρόνους καὶ καιροὺς, ἀριθμούς τε πολυετεῖς τὸ αἰώνιον αὐτῆς κατατεθεῖσθαι, οἰόμενον ἐν τῷ πλήθει τῶν χρόνων μιμήσασθαι αὐτῆς τὸ ἀπέραντον*. This text suggests that the Marcosians, like the Neoplatonists, distinguished between an instantaneous indivisible Eternal Now (characterized as *τὸ ἀπέραντον καὶ αἰώνιον καὶ*

*ἄοριστον καὶ ἄχρονον*) and the divided nature of created time. On the Neoplatonic notion of Eternity cf. further below. *Contra* J. Daniélou, *Message évangélique et culture hellénistique* (Tournai 1961) 301, *ἀπέραντος* is not employed in a transcendent sense by St. Paul at Romans 11. 33 or elsewhere. Except at I Timothy 1. 4 (*γενεαλογίας ἀπεράντοις*) the term is entirely absent from the New Testament.

9. Cf. Früchtel's "Clemens Alexandrinus und Albinus," *Philologische Wochenschrift* 57 (1937) 591 f.
10. Cf. R. E. Witt, *Albinus and the History of Middle Platonism* (Cambridge 1937; rp. Amsterdam 1971) 4, and, e.g., R. Klibansky, "Ein Proklos-Fund und seine Bedeutung," *Sitzungsberichte der Heidelberger Akademie der Wissenschaften*, Phil.-hist. Klasse 1928/29 No. 5, p. 7. That the author of the *Didaskalikos* was in the relevant passage influenced by the First Hypothesis has been emphasized by A. H. Armstrong. *The Architecture of the Intelligible Universe in the Philosophy of Plotinus* (Cambridge 1940) 10. Professor Armstrong went on to argue (*op. cit.* 16, n. 3) as follows: "It must be remembered, however, that Albinus regards the *Parmenides* simply as a logical exercise, not as containing any profound metaphysical teaching (*Didaskalikos* 6). He must, therefore, be held to be unconscious of the source of his "negative theology"." I have expressed reservation regarding this latter conclusion in my "ΕΠΕΚΕΙΝΑ ΝΟΥ ΚΑΙ ΟΥΣΙΑΣ," *Vigiliae Christianae* 23 (1969) 99 f. Any assessment ancient or modern of Plato's intentions in the second half of the *Parmenides* must of course take into account that Plato himself had employed the terms *γυμνασία* (*Parm.* 135 D 7) and *πραγματειώδη παιδιὰν παίζειν* (*Parm.* 137 B 2) in reference to this portion of the dialogue.

## The Neoplatonic 'One' and the Trinitarian 'APXH'

the conflict over the unity of the principle and  
its relation to the 'identity' of the absolute  
in Schelling and Hegel.

by J. Patrick Atherton

*Dalhousie University*

In his book, *Pagan and Christian in an Age of Anxiety*, E. R. Dodds, after discussing many of the subordinate aspects of the conflict between the Christian and the Hellenic tradition, turns finally to the intellectual side of the issue and raises the question: "what was the debate about?"<sup>1</sup> If an answer were to be attempted in a language appropriate to the time, it could be said to be "a dispute about the ἀρχή, or more particularly about the precise nature of the 'unity' to be ascribed to the principle." All the secondary conflicts, whether of thought or of practice, - the origin of evil, the status of matter, the authority of the imperial order - can be clarified only so far as they are understood in relation to their source or principle and recognised as consequences of the demands upon men as they moved at all levels towards a re-definition of the ἀρχή.

The recognition of the predicateless unity or pure self-identity of the ἀρχή lay at the root of the entire Neoplatonic tradition: in its utter simplicity, raised above all duality - even the primary differentiation of the intelligence from the intelligible world - the ἀρχή retreated into inaccessibility and unknowability. On this point the later elaborators of the position found the Plotinian doctrine insufficiently precise: Iamblichus and Damascius exhausted the resources of language

and intellectual virtuosity to ensure the simplicity and transcendence of the One. Besides the unknowability of the principle – a result of its pure indeterminateness or simplicity – a further consequence of the of the purely self-identical ἀρχή of the Neoplatonists was the ἀπορία encountered in explaining satisfactorily the relation of the principle to its derivatives, that is, of principium to principia: if the ἀρχή was complete *in itself*, prior to its diremption into the world of which it was nevertheless the source, how could these two aspects of the principle – as self-sufficient in its abstract unity or *causa sui*, yet also *causa omnium rerum* – be intelligibly related to each other? As M. Trouillard says: Neoplatonism “pose a priori qu’entre le Principe et ses dérivations aucune déduction, aucun processus logique n’est concevable, parce que le Bien n’est plus Idée.”<sup>2</sup>

The trinitarian ἀρχή, by contrast, appears as an attempt to reconcile the requirement of unity with that of difference within the principle itself: ἐτερότης is now recognised as a moment within the unity, as belonging to the principle *as unity*. Such a position requires a very different interpretation of the relation between the principle and its derivatives than that found in Neoplatonism: the manifestation of the ἀρχή in the sensible and intelligible orders belongs to its essential nature as principle – the principle is essentially self-revealing. According, the procession of all things from the ἀρχή as their source and their return to it as their end have to be understood as constituting its very identity: the ‘process’ is one of *self-determination*, that through which the principle attains its unity with itself. The primary opposition, then, between the two positions can be characterised as follows: for the Neoplatonists the unity of the ἀρχή is a *unity of indeterminateness* – just because it is the source of all the differences between things, prior even to the difference between subject and object, the principle excludes distinction from itself and is, in this way, ‘one’; on the trinitarian position however, the principle is a *self-determining unity* – determinateness does not fall *outside* the unity of the principle: rather, in the completest differentiation the principle returns upon itself, is one with itself.

It is this distinction – between the ἀρχή as the purely indeterminate and as self-determining unity – that this paper

will examine as its primary concern; it is hardly necessary to add that the question on the Christian side is discussed in a language suitable to the religious consciousness, that is, with the admixture of an unavoidable representational element; the inadequacy of the language to the doctrine it expressed became apparent only with the later development of philosophy; in our period it was entirely appropriate to the intellectual culture of the times. Secondly, however, since in this conference we are concerned with the relation between Neoplatonism and modern culture, it may be permitted to relate the discussion to that moment in the history of modern thought when the intellectual content of the ancient dispute was recognised with something like its original profundity: in the conflict between Schelling and Hegel over the nature of the absolute, Hegel was able to find in the trinitarian position a principle which, when developed into its proper philosophical form, would permit him to emancipate himself from Schelling’s ‘Philosophy of Identity’. In recognising that the absolute had to be conceived not as “substance but as subject”, or, in the precise sense of his later philosophy as “Geist”, Hegel separated himself decisively from Schelling’s principle of “Absolute Indifference”.

# I

Why does Plotinus regard it as necessary to go beyond the level of νοῦς to find the ἀρχή? The argument is found in many texts but the expression of it at *Enneads V, 3, 13* will be most suitable for our purposes: there it is claimed that the principle is in truth unspeakable because “if you say anything of it, you make it a particular thing.” But that which is beyond all things, beyond even the “most venerable of all things, the intelligence” cannot be regarded as one of them; if we speak of it as knowable and as knowing, we are making it manifold. If we attribute thought to it, we are treating it as in need of thinking. If, indeed, in any way we suppose thinking to be associated with the One, we must regard such thinking as unessential to it. What thought does is to gather many elements to a unity and so become conscious of a whole. This is true even when the mind does not regard the object as external to itself as it does in discursive thinking; even in self-consciousness the attempt to

turn upon itself introduces division. When, in the very act of apprehending its own simple nature, it says 'I am in being' (*ὅν εἰμί*), it fails to grasp either being or itself . . . therefore, if there is something which possesses absolute simplicity, it cannot think itself.

The intent of the argument is perfectly clear: the unity of the intellect with itself in self-consciousness — of *νοῦς* with *νοητόν* in *νόησις* — is imperfectly 'one', therefore the *ἀρχή*, which must be independent of all 'otherness', be purely self-referred, in order to *be* a principle, must be sought 'beyond'. If, as is commonly supposed, the Plotinian doctrine on the *νοῦς* hypostasis incorporates Aristotelian teaching on the point, it is worth while considering briefly the Aristotelian sources and Plotinus' treatment of them. The main sources are doubtless the treatment of the divine thinking in Book Lambda of the *Metaphysics* and the relevant passages on *νοῦς* in the *De Anima*; the doctrine Plotinus finds there is considerably fuller than that usually allowed by modern interpreters. Nothing in these passages has perplexed modern exegesis more than the question of the relation of the divine thinking to its object.<sup>3</sup> It is in the divine thinking that Aristotle finds the primary substance, pure *ἐνέργεια*, that in which there is no potentiality: what does this pure thinking think of? Evidently of itself, for if it thought of anything external to itself "there would evidently be something more precious than thought, viz. that which is thought of" (1074b 29-30). The divine thinking must then be self-thinking: does it follow that the divine thinking has no knowledge of the world? Many in recent times have concluded that it did<sup>4</sup>; however, the tradition of comment in ancient times (Alexander, Themistius, Plotinus) was rather that the divine self-thinking is a knowledge of 'things' in their forms or definitions, their *εἶδη*, for which its (i.e. pure intelligence) apprehension of the indivisible unity of elements in the object (as *ἀπλᾶ*), is, at the same time, a grasping of the unity of the object itself. In *νόησις* there is no piecing together of the elements of the form in the syllogistic manner of 'scientific' knowing or *ἐπιστήμη*; the mind is not externally related to its objects at all — the objects are either possessed or not possessed,

and the only alternatives are knowledge or ignorance; as Aristotle puts it, in *νόησις* we are either in contact or touch (*τιγέῃ*) with the things or we are not. The mind cannot be mistaken about what constitutes an element in its consciousness of itself; at 1072b 20 Aristotle explicitly asserts that the mind thinks itself by participation in the intelligible object; for, "it becomes an object of thought in coming into contact with and thinking its objects, so that thought and object of thought are the same" (*ταυτόν νοῦς καὶ νοητόν*). The divine life is precisely this actual identity of thinking with its object (1072b 21-25).

What the ancient interpreters found in these texts was a doctrine of *νοῦς* in its completeness (that is, as divine or completely 'actual') including the world (or more precisely, the *εἶδη* of things) as its object. How this divine principle is present in nature; how this pure self-consciousness, which in its perfection includes the forms of things as one with itself, is present in human cognition, which only attains its objects gradually by laboriously connecting together the data of the senses (that is, is only 'potentially one with the intelligible object' *δυνάμει τὰ νοητά*) are questions of the greatest importance for later philosophy; we must leave these aside to look more closely at the unity of the intelligence with its object suggested by these texts, because it is this conception of the unity of the *ἀρχή* that Plotinus finds inadequate and which moves him to posit a principle beyond *νοῦς*.

The *ἀρχή* (according to these Aristotelian texts) is not *νοῦς*; it is *νόησις νοήσεως*, the actuality of mind thinking its objects and thinking *itself* in its objects. Therein lies the unity of the principle: subject and object are one in *νόησις* — a unity which is, in a sense, *prior* to the distinction between them, in that, separated from the unity which is their truth, they are subordinate and incomplete elements in the *ἀρχή*. The unity of the principle is a unity of these essentially correlative elements: it is not abstract self-consciousness which is the Aristotelian principle but the concreter unity of thought with itself in its object.

The Plotinian doctrine of *νοῦς*, however, fastens upon the moment of distinction within self-consciousness and regards the unity of the two sides as something secondary, so that the

intelligence and the intelligible world have a certain completeness in their independence of each other — outside their unity with each other. Since they are not seen as forming a perfect unity in their inseparable opposition to each other, a principle that is properly one must be sought beyond them.<sup>5</sup> The question then arises: what is the character of this unity, and how, in its isolation, does it generate a world?

The primary unity can, according to this position, have no character, no determinateness; all the differences between things, the distinction between mind and its object, presuppose and point towards it, but none are applicable to it. We can only indicate its nature negatively — by saying what it is not. The 'negative theology' is not, however, as reliable an approach as has sometimes been supposed; a negative relation remains a relation and compromises the utter transcendence of the One; it seems we cannot attach *any* name to the principle, even the 'One' or the 'Good' without bringing it down into a relation with something other than itself. It is, nevertheless, this very dependence of all other things on something beyond themselves that has necessitated our affirmation of its transcendence: we are required to think of it in relation to them in order to know it as absolute or primary. We must accordingly understand the terms we use as expressing its proper nature: it is really One — if it is to be the source from which all things derive; it is really the Good — if it is to be the final cause to which all things move. It is this consideration that drives (probably) Iamblichus and (certainly) Damascius to double the first principle or posit a One beyond the One: Damascius will not even allow 'transcendent' ἐξηρημένον to be used since that presupposes a relation to other things; we cannot know it even negatively — we must simply experience its presence in a prophetic way (μαντεύεσθαι) — οὐδὲ ἄρα ἀρχήν, οὐδὲ αἰτίων ἐκείνην κλητέου, οὐδὲ πρῶτον, οὐδὲ γε πρὸ πάντων, οὐδ' ἐπέκεινα πάντων. At the end of its development Neoplatonism cannot reach the principle either by affirmation or negation: indeed not even negation of the negation can avoid positive reference, and the inadequacy of language presses heavily upon Damascius. This, doubtless, is why commentators have discerned an 'inclination to irrationalism'<sup>6</sup> as the tradition drew to its conclusion; the

whole philosophical enterprise is called in question, for, as Professor Wallis has remarked "the consequences [of Damascius' position] were little less than the annihilation of the whole Neoplatonic hierarchy."<sup>7</sup>

Another consequence of the transcendence of the One is the difficulty involved in understanding its relation to its derivatives. We ascend the scale of being because each lower level is defective or incomplete and has need of a higher to explain it; but, though the lower has need of the higher, the higher does not in turn seem to require the lower or bear any essential relation to it. When, therefore, we reach the highest, this is regarded as having need of nothing but itself. The One, as complete in itself, has no need to produce a world; the *principium* need not disclose itself in *principiata*; since in fact there are *principiata*, some way of connecting the derivatives with their principle must be found. The connection is made, of course, through 'emanation': the Good can look to nothing but itself, without any activity directed towards them. The process is compared to 'irradiation' or 'overflowing'; Plotinus is quite aware of the deficiency of these metaphorical analogies as he shows in his critique of Gnostic theories of emanation. But even when expressed more adequately as an essential characteristic of perfection that it should generate something other than itself, it hardly elucidates the division between what a thing is and does in relation to itself, and what it is and does in relation to other things: the metaphors merely indicate the difficulty in trying to separate a thing's inner nature from its outward activity — a self-involved activity, which only accidentally discloses itself outwardly, is an incoherent conception. In the case of the One, it would require that the principle should have an external effect which is not necessarily involved in its own nature. The difficulty points in truth to a very different conception of the principle as essentially self-manifesting: to such a principle we now turn.

\*

The trinitarian position appears as a different solution to the problem of the relation between the moments within the

ἀρχή. No less than the Neoplatonic tradition did it hold to the strictest unity and transcendence of the principle; but it conceived of this transcendent ἀρχή as in some way having 'revealed' itself. The unknown god had made himself known; and this 'making himself known' was not considered an inessential aspect of the divine nature, but a constituent moment of his very identity – the moment of manifestation was god himself, and not some 'intermediate' entity. The effort to hold together in a unity the two essential aspects of the ἀρχή as this tradition understood it – as *causa sui* and *causa omnium rerum* – resulted in the triadic formula agreed upon as orthodox in the fourth century. This defined a principle which was a perfect unity, although differentiated into three 'persons'. In the language of philosophy, the ἀρχή was both one and many: *μόνος ὢν πολὺς ἦν* (Hippolytus, *Contra Noetum*, 10). This came to be regarded as the *sine qua non* of orthodoxy, through which the new religion distinguished its belief from all previous formulations of the ἀρχή, both philosophical and those of its own heretical variants: all the resources of the Greek language were exploited in the attempt to fix the new ἀρχή in an unambiguous definition. The trinitarian formula was understood as reconciling unity with difference in the most satisfactory way. The difficulty facing the framers of the doctrine was to avoid sacrificing the unity of the ἀρχή in the attempt to explain its self-differentiation – and self-differentiation was essential, if it was to be held that the ἀρχή had fully revealed himself and disclosed his real nature. On the other hand, this manifestation of the ἀρχή had to be regarded as a 'substantial' or necessary moment in its identity: the process of self-differentiation constituted the very being of god and was not merely a camouflage behind which the true deity subsisted as an abstract unity. To insist upon the two aspects with equal firmness was a more difficult and ambitious position than that of the opponents of the orthodox formula: at bottom, all the rival positions were variations of the more easily comprehensible doctrine that the divine unity necessarily excluded multiplicity; on such a view the full trinitarian formula was merely a cover for tritheism.

It is impossible to trace here the process by which the new ἀρχή acquired an adequate terminology and formulation; it is

sufficient to indicate it was accomplished through a re-shaping of the Logos doctrine. The intellectual effort of the earlier centuries was to overcome all suggestion of inferiority in the status of the Logos or the Son – an effort which went against the grain of all emanation theories of derivation from the principle: this expressed the insight that the object of pure or divine knowing was not to be regarded as an inessential element in, or something external to, the nature of the primary ἀρχή (and, therefore, something which would compromise its simplicity or unity) but was rather that without which there would be no divine knowledge at all; the object becomes a constituent moment of the principle and is compatible with, and, indeed, required by, its unity: the ἀρχή is a pure knowing in which the knower, in knowing the object, knows only himself – the deity is himself only in that return-to-himself, which is 'spirit'.

What the principal consequences of this view of the ἀρχή were can only be tentatively suggested here. The principle is both subject and object without any infringement of its unity. For the Neoplatonists the subject-object relationship did not become a perfect identity in νοῦς and the perfectly unified ἀρχή had to be sought beyond this duality. Such a view of the principle led to the difficulty that the first derivation could not be logically deduced from it: there seemed to be no logical reason why such an abstractly self-identical unity should divide itself into the subject-object relation of νοῦς. The trinitarian ἀρχή sought to avoid this objection: it was not a unity complete in itself prior to its diremption into subject and object, but a unity whose identity consisted in this very act of self-diremption and which was just as much subject as it was object. By insisting on the moment of 'procession' as belonging to the very nature of the ἀρχή the creation of the finite cosmos in space and time assumed a new significance: the sensible world was no cosmic error, incompatible with the divine perfection but was involved in the nature of divine self-consciousness (the Father's consciousness of himself in the Son involves him as the *locus* of the κόσμος νοητός). Further, and most importantly, the divine knowing (the very essence of the ἀρχή) was an unlimited or infinite one; for it was a knowing in which all otherness or externality which could limit it was overcome.

God's knowledge of the things of the sensible world was not of them as 'other' but was involved in his own self-knowledge. This meant that there was no need to look for an intermediary link between the infinite and the finite world, which would yoke them uneasily together: they did not need to be brought together because they had no independent existence apart from each other. The infinite included the finite within itself as a moment in its own identity: the infinite was only infinite when understood as producing a world external to itself, which nevertheless remained one with itself in its own self-knowledge. Nor is the infinity of the ἀρχή one of pure indeterminateness, that is, mere absence of all determinateness. As the ἀρχή produces the intelligible world out of itself, all the categories of the intelligible world (i.e. the categories by which the world is made an object for intelligence) become modes of the divine self-consciousness: the principle is not in-finite in the sense of being beyond all limitation but in the sense of being the source of all determination through which he comprehends only himself. As a self-determining unity the principle can be *known*; it is open to intellectual apprehension as never before; this radical intelligibility of the principle is confined initially to the religious consciousness, and it lay in the remote future of philosophy to remove this limitation and attempt to understand all aspects of nature and spirit in the light of this.

## II

It remains to attempt to relate this discussion of the unity of the principle of the debate over the nature of the Absolute in idealism. The position grew out of the Kantian critique of experience; after Kant it was impossible to accept the ordinary view of experience as something immediately given for thought and not constituted by it. The possibility of knowledge was the unity of the ego and non-ego: how was this unity to be understood?

The Kantian philosophy left the unity quite inexplicable: the objects of knowledge were indeed essentially related to the unity of self-consciousness, but these objects were 'phenomenal' only — that is, they were not the 'real' objects, which were regarded as 'things-in-themselves' or things *not* essentially

related to, or knowable by, the subject. Fichte denied the independent existence of things in themselves, external to subjectivity; the non-ego was reduced to a negative condition through which the ego realised its own life of self-determination; but this negative condition was essential to self-consciousness and had to be produced in some inexplicable way out of the ego itself. It appeared as an incomprehensible moment of opposition of the mind to itself. Schelling, however, did not accept this merely negative view of the relation of spirit to nature; the two sides are one in the absolute — that is, the unity of ego and non-ego is a unity of indifference. All objects, whether mind or matter, are simply forms of this identity of subject and object, and, from the point of view of the absolute all these identities are one. Nature is not merely the negative of thought, but has revealed in it the same principle that constitutes the ego in man. Schelling's way of putting it is: there are no qualitative, but only quantitative, differences in things — from the point of view, or within, the absolute.

At first, when Hegel appeared as a colleague of Schelling and they were joint editors of the 'Critical Journal', it seems that he did not object to Schelling's formulation of the identity of the absolute: it was common to both their positions that there is a 'unity' beyond all differences, which realises itself through all distinctions, and in relation to which all differences must be explained: they further agreed on describing this unity as 'spiritual'. Hegel, however, very soon began to distinguish himself from his colleague precisely on the notion of 'spirit' and more particularly about how the absolute was apprehended. Already in the early treatise, "On the Difference between the Fichtean and Schellingian Systems", he is found asserting that the identity of philosophy is not an abstract identity simply opposed to difference but a spiritual unity which differentiates itself in order that, through a process of division and reconciliation, it can achieve a higher unity with itself. Further, the mode of cognition of the absolute, the 'intellectual intuition' of Schelling, is not regarded as exclusive of the process of reflection but as containing it; though at this stage, Hegel still considered thinking within philosophy as quite distinct from that outside it. By the time of the *phenomenology* Hegel's hold

upon his own position had strengthened to the point that he had to separate himself clearly from Schelling: hence the critique in the Preface of Schelling's *Absolute* as the "night in which all cows are black" (Bailey, (trans.) p. 79) and "intellectual intuition" as a "sort of ecstatic enthusiasm which starts straight off with absolute knowledge, as if shot out of a pistol" (ibid. p. 88).

A more adequate view of the absolute is attained only when it is understood as subject: "in my view, everything depends upon grasping and expressing the ultimate truth not as Substance but as Subject as well." (p. 80). He goes on to explain that a being which is truly subject is one which is properly actual (*wirklich*) only in the process of positing itself, that is, of splitting up what is simple and undifferentiated, of duplicating and setting factors in opposition. "True reality is merely this process of reinstating self-identity, of reflecting into its own self in and from its others, and is not an original and primal unity as such, not an immediate unity as such." The divine life, though no doubt an undisturbed identity, consists in its being objective to itself, conscious of itself on its own account (*für sich zu sein*).

The echo here of the trinitarian debate, and the many points in the dispute with Schelling that recall the Neoplatonic discussions of the One, are not accidental: it is possible here only to indicate them and to suggest that fuller and more serious study could only confirm the importance to be attributed to the issues with which the intellectual life of the later ancient world was concerned; the obvious increase of interest in these studies, as well as the reviving interest in the Hegelian philosophy, make it a reasonable expectation that this will be so. Hegel saw in the attainment of the trinitarian position the expression in an undeveloped and representational form of distinctively 'Western' culture; the principle needed to be liberated from its theological form and shown to be adequate to the task of comprehending the concrete freedom to which the West aspired. To the end of his life Hegel regarded himself as an orthodox trinitarian — a position which the theologians have not usually been very ready to accord him. But what the trinitarian doctrine in truth is, and what form it takes in later

thought, cannot be understood until the content of the ancient disputes is once again comprehended philosophically.

# The Apprehension of Divinity in the Self and Cosmos in Plotinus

by A. Hilary Armstrong

*Dalhousie University*

This may seem an odd title for a paper which is intended to commend the philosophy of Plotinus as one which, as I believe, has some contemporary relevance. The words "apprehension of divinity in self and cosmos" are likely to displease irremediably two considerable bodies of contemporary opinion. They will of course displease that very large number of contemporary philosophers to whom a phrase like "apprehension of divinity", or any talk about "God" or "the divine" is meaningless: and those who adhere to some older traditions of Western theistic philosophy will find the language offensively "pantheistic", and, if they can be persuaded to explain this large, vague term of theological abuse further, will say that anyone who talks like this is looking for divinity in the wrong place. He has forgotten that God is the Wholly Other and that there is an unbridgeable gulf between the Creator and his creation. I have some respect for both these groups, and do not think that the arguments which they can bring against the Neoplatonic, or any similar position ought to be neglected. But I do not think that I have either the charismatic or the eristic competence to deal with them. I have not the sort of faith which would enable me, in the proper manner of prophetic theism, to shout religious opponents down with yet another version of what professes to be the Word of God: nor do I think that I am able to argue people out of what is now, especially in the case of the unbelieving philosophers, a settled traditional belief supported by revered authorities. I propose, therefore to address myself to those of our contemporaries, a large and, probably, increasing number, who do not belong to either of these groups and are not likely to find the phrase "apprehension of divinity in self and cosmos" too preposterous to be worth considering further. I have the rather faint hope that by

confining myself to positive elucidation for people assumed to be sympathetic I may be able, here and there, to say something which will make the position I am trying to explain seem less ridiculous or shocking to others.

What I propose is that in the thought of Plotinus we do not, to begin with, apprehend divinity in two separate ways, one in our selves and one in the cosmos, but we have a single apprehension or awareness of divinity in self and cosmos taken together, and that we do not in fact leave the cosmos altogether behind until our awareness of divinity becomes so intense that we go "alone to the alone". In explaining this I hope to be able to show that the Neoplatonic way of thinking may still have some life and meaning. We cannot of course expect Plotinus, or anybody else, to do our own thinking for us, and some aspects of his thought which will be discussed in this paper will inevitably seem odd, antiquated and irrelevant to present concerns. But I believe that if we start our own reflections with a study of that thought which is sympathetic as well as critical, Plotinus may give us a lead to a better understanding of the world and may help us to adjust our attitudes and valuations in a way which may help us to deal with some of the most pressing problems of our time, and especially to do something towards closing the gap between man and non-human nature which has been steadily widening through the Christian and rationalist centuries with, as we are now beginning to see, disastrous results.

It is now high time to say something about my use of the words "apprehension" and "divinity". On "apprehension" there is nothing very helpful to be said, because I agree with Plato and many modern religious philosophers in supposing that what it means can only be learnt in practice, and by each in their own way. One can neither explain what is meant by the apprehension of God nor tell anyone else an infallible method for apprehending him. One can only recommend a serious attention to and enjoyment of the world in the hope that those who apply themselves to it, holding in check for a time the desire of power or satisfaction, may become aware of the divine presence. As for my use of "divinity", the Neoplatonic tradition which I am trying to explain, and with which on this point I

agree, makes things rather difficult for its interpreters by insisting that the first principle, the One or Good, which corresponds to what most of us who still use the word mean by "God", is absolutely unknowable and ineffable. There is of course nothing scandalous to a modern religious thinker in this insistence. At any meeting of theologians or religious philosophers in the West the unknowability of God is sure to be asserted by a variety of speakers from a variety of different points of view, and it is a commonplace of religious thought in the East. But all too many of those who make this assertion, fail to apply it sufficiently in their practice. They seem to fail to realise that if God is ineffable you can't talk about him: you can only use language which will prepare people's minds to attend to such indications as he may give of his presence. The pagan Neoplatonists, from Plotinus to Damascius, of course knew this very well and stated it with increasing clarity (even if they quite often seem to go rather too far, on their own premises, towards forming concepts or enunciating propositions about the One or making him the premise or conclusion of a discursive argument). The great masters of the Athenian School, Proclus and Damascius, do a good deal at this point to develop what is not always clear in Plotinus (thought I do not myself think that they do more than bring out what is, sometimes at least, implicit in his thought). Both of them emphasise strongly that it is necessary in the end to negate one's negations (which does not mean simply restoring the original positive statements which are negated, with a decorative label, a *hyper* — or *eminenter*, attached), otherwise one would be left with a sort of pseudo definition of One as a something which was not anything, instead of a profoundly fruitful and illuminating silence. And Damascius, following a view of Iamblichus<sup>1</sup> which was not adopted by Proclus, insists that we must go even beyond the One to find the unknowable First. In the first pages of his great critical, and at many points liberatingly destructive, re-thinking of the vast metaphysical system which he had inherited<sup>2</sup>, in strong opposition on many points to the too smooth, over-clarified, misleadingly coherent-looking scholastic version of it produced by Proclus, he insists that the One from which all things proceed can not only, in a way, be defined and understood in relation to the all but must in some sense be all

things which proceed from it, in however super-simplified a way<sup>3</sup>: and, with an agonized sense of the inadequacy of human thought and language which is impressive and refreshing to those who sometimes feel that Proclus knows much too much about the unknowable, points his readers on to that for which he has no proper name. The most important result of this extreme apophatism for our present purposes is that this unnameable and unknowable divinity is not in a relationship to everything else which can simply be defined as "transcendence"<sup>4</sup>. Its relationship to the world, as we should expect, cannot be defined at all (even by saying that it has no relationship). Once it is clear that God for the Neoplatonists stands in this unknowable relationship to all else, anyone who is religious in a Neoplatonist way is free to see him in mind and world wherever his presence seems to be indicated. And though another side of their thought led the Neoplatonists to think (in one way or another) of his presence as mediated through a hierarchy of lesser divinities, this idea of divine hierarchy is probably incompatible with their ultimate conclusions about divinity (and leads them into many other difficulties) and can, I think, be neglected by a modern who wishes to make Neoplatonism the starting-point for his own religious thinking. The hierarchy of hypostases should, of course, be given its proper place in any historical account of Neoplatonism, and will not be ignored in what follows.

The first apprehensions which we have of divinity according to Plotinus are on the level of his third hypostasis, Soul. In the great exhortation to return from self-forgetfulness and self-alienation and remember our true selves and our Father which begins the treatise *On the Three Primary Hypostases* every soul is told to remember that it made all living things and the whole world and gave life to everything<sup>5</sup> (in the Plotinian universe everything is alive and is in some sense thought<sup>6</sup>). In the further development of this in the rest of the chapter, and still more in the careful discussion of the relationship of our souls to the Soul of the All which begins the great treatise *On Difficulties About the Soul*<sup>7</sup>, Plotinus makes clear that this does not mean that our souls are parts of or simply identical with the cosmic soul which makes the physical universe real, alive and

divinely excellent. We are of one kind with it<sup>8</sup> and in that sense just because we are soul can claim its divine creativity as our own. But the living unity of the Plotinian hypostasis, in which every part is the whole in so far as it thinks universally, but each in its own way, admits of considerable differences of character and rank. Plotinus never abandons his conviction, stated in the early treatise *If All Souls are One*<sup>9</sup>, of the fundamental unity of soul: but he modifies it in the direction of acknowledging a greater diversity and degree of independence to the individuals within that unity. The World-Soul is our elder sister<sup>10</sup>, and our attitude towards her, it seems, should combine a sense of intimate kinship with an affectionate and respectful independence and assertion of fundamental equality. We can aspire to "walk on high"<sup>11</sup> like her, sharing in her formation and vivifying of the whole and enjoying that ideal relationship to body which belongs to her and to the souls of the great parts of the universe, sun, moon, earth and stars. Our awareness of any sort of divinity in ourselves is an awareness of a divinity which, without abolition of differences or loss of personal identity, we share with the living thought which is all the reality of the cosmos, in whose everlasting perfection we can rediscover our own forgotten natures.

This leads Plotinus into some very curious excursions into cosmic psychology in his great treatise on the soul, the second part of which contains extensive discussions about whether the World-Soul, the heavenly bodies, and the earth have memory or perception or need them to perform their functions in the universe.<sup>12</sup> The details of these are not relevant here, but it is important to realise that for Plotinus, as for any ancient Stoic or Platonist, any philosophical psychology which concerned itself exclusively with the nature of the human soul would be hopelessly unsatisfactory and inadequate. (Mediaeval Christians here to some extent follow the ancients; they are interested in angelic psychology, and angels for them at least sometimes have cosmic functions, though these do not seem to occupy a very important place in angelology). Plotinus cannot consider man, as a being who perceives, remembers, thinks and acts intelligently, in isolation from the greater embodied souls which, though they do not need memory or deliberation (any more

than man does at his highest), do act intelligently and have all the awareness of the world whose reality depends on them which is necessary to them. This may seem a mere curiosity of the antique way of thinking, hopelessly out-of-date and incompatible with our vastly extended knowledge of the universe, and particularly of the celestial regions. It would be difficult for us, imaginatively as well as intellectually, to recognise and venerate the goddess Selene in the dreary, dusty receptacle for excessively expensive junk with which we have all become so boringly familiar of late years. But if we study the treatise *On the Soul* and other documents of the ancient faith in the living organic unity of the universe of which we men are not very important parts, and study them sympathetically as well as critically, we may at least begin to feel again the need for some sense of unity with our world and not be content to stand apart from it as isolated, superior thinking beings over against a mass of brute matter in which there is no living thought originatively present, so that we can exploit it as we please in our own supposed interests without worrying about any non-existent cosmic holiness or intelligence, and even imagine that we are necessarily improving it by "humanizing" it. Even if we cannot entirely or uncritically accept Plotinus' way of asserting the unity-in-distinction of reason and nature, we may come to desire to find some satisfactory way of establishing it for and in ourselves.

As our apprehension of divinity, according to Plotinus, progresses we find that we are not only one with other and greater souls in the unity of the Third Hypostasis, but belong, with all Soul, to the greater community of the Second. We are rightful members of the intelligible cosmos which is the Divine Intellect, at once the inner reality and the transcendent exemplar of our perceptible world. A great deal has been written about Plotinus' astonishing accounts of his intelligible world, in which Platonism, Aristotelianism and Stoicism unite with his own immediate experience to give a richly imaginative and philosophically strange picture of a cosmos at once furiously active and timelessly at rest, in which an extreme and delightful variety is held together in the most perfect unity possible below the One. It is an account which brings out very

clearly two problems which are implicit in a great deal of ancient and mediaeval thought. One is the paradox involved in the phrase "eternal life". Can we eliminate all ideas of real duration, process and even change from our thought about any eternal reality as completely as the traditional theologies require if we represent that eternal reality as genuinely alive, and living a life of the utmost imaginable fullness and intensity?<sup>13</sup> The other is a question about a complex intuition which is completely non-discursive.<sup>14</sup> Can we at our highest, or even the Divine Intellect, with which we are then one, have an awareness of a reality (even if we are it) which is not only one, but discrete and diversified, with very complex internal relationships, without that awareness being in some way discursive? Is not the clear distinguishing of parts (even Plotinian parts) and the accurate observance of relationships essentially and inescapably discursive? I mention these problems not in order to solve them, which is beyond my capacity, or to suggest that the ideas of eternal life and complex non-discursive thought should be dismissed from further consideration as absurd, which is far from my intention, but to point out that they arise in this context from Plotinus' determination to get everything in the sense-world into his intelligible world. It must for him possess in a far higher degree all the values and beauties of which we are aware here below in all their splendid variety, even if they are values and beauties which seem to us, on careful reflection, to be bound up with transitoriness and passage and dispersion in space and time. This means that the relationship of the two worlds is inevitably a very intimate one, and Plotinus (though his emphasis varies) is sometimes anxious to stress this intimacy and immediacy<sup>15</sup>. And our own relationship with this higher or inner world is so intimate that Plotinus sometimes says that we are it.<sup>16</sup>

When, therefore, we reach the highest apprehension of divinity of which we are capable before the final union and have transcended our limiting particularities, we still find ourselves one with a world or community of living minds, including greater beings than ourselves<sup>17</sup>, which is the archetype and inner reality of the world of sense-experience and lower soul-activity. We are by no means alone or isolated and

separated from the whole. At this point it will be as well to distinguish two questions which are sometimes confused: First, is the process or ascent, of discovering our true natures and strengthening our apprehension of divinity till we are ready for the final union, best carried out in isolation or co-operatively? The answer to this is not altogether simple. It has often been noticed that the theory of Plotinus differs here very considerably from that of Plato. For Plato<sup>2</sup> progress in philosophy required affectionate co-operation and continual dialogue. A philosophical community like the Academy was absolutely necessary, and the ideal environment for the philosopher would be a larger and more closely integrated community, the philosophical city-state. Plotinus probably did not presume to disagree with Plato on this last point, as the curious episode of Platonopolis shows<sup>18</sup>. But his general conception of the philosophic life is one of withdrawn solitary concentration, as the *Enneads* repeatedly make clear. Contemplation is primary, and is best pursued alone. Communication is secondary, and hinders rather than helps contemplation, though it is the philosopher's duty to impart what he has seen to others and help them to see it for themselves. His position is finely stated in a passage which sums up the teaching of the first six chapters of the treatise on contemplation: "The truly good and wise man therefore has already finished reasoning when he declares what he has in himself to another: but in relation to himself he is vision. For he is already turned to what is one, and to the quiet which is not only of things outside but in relation to himself, and all is within him"<sup>19</sup>. In practice, however, he by no means withdrew from the world or shunned society, till he was compelled to do so in his last illness, and his teaching at Rome was not just a matter of handing down the results of his contemplation to his disciples: there was plenty of vigorous discussion and dialogue<sup>20</sup> (as there must have been earlier in the group around Ammonius) and it is doubtful whether he could have done without it; there is much in the *Enneads* which suggests the stimulus of discussions within his circle. However different his theory was, in practice philosophy seems to have been for him almost as much of a social activity as it was for Plato.

The second, quite different question is: does one discover oneself in the course of the philosophic ascent as an isolated individual, progressing towards a solitary perfection, or as part of a larger whole? The answer to this has already been given. One discovers oneself as part of the largest possible whole, and a part which in a sense is that whole. The boundaries of the self are those of the intelligible cosmos. (This is of course one reason why Plotinus in theory felt less need for a philosophic community; it could add nothing to the All within him). One might almost say that for Plotinus the *corpus mysticum* is the universe and the company of heaven includes the whole inner reality of the world. And no genuine Neoplatonist philosopher can be satisfied to think of himself as a member of any smaller or more exclusive community. Here the thought of Plotinus is in accord with, and the study of his writings may reinforce, some of the best tendencies in the religious thought of our time which are leading more and more to the rejection of the exclusive ways of thinking of the past which separated man from man or man from nature. I am inclined to think that Neoplatonic Paganism and its derivatives have always in our intellectual history been working against the tendencies derived from other sources which have led to the drawing of sharp lines and the making of exclusive divisions between man and non-human life, or Church and world, and so on: in our own time this Neoplatonic pressure against exclusiveness is being powerfully reinforced in various ways, notably by influences coming from India. It is in this inner, intelligible, totality of being that the soul must ascend to its solitary union with the One, and it must make every effort to dwell in it consciously until the moment of union comes. In all the great mystical passages of the *Enneads* it is from the world of Intellect that the ascent is made. We are drawn to enter and unite ourselves with that world by the impulse to union with the Good which comes from the Good, and Intellect only attracts us by the light playing upon it from the Good, without which it is altogether uninteresting<sup>21</sup> (though elsewhere Plotinus seems to think that the beauty of Intellect desired by itself can distract us from the Good<sup>22</sup>). It is for the sake of the Good, and under the impulse of the Good, that the whole enterprise of intellectual ascent and

expansion is undertaken. But it is characteristic of the mysticism of Plotinus that there is no short cut, no way in which the isolated individual soul can jump straight into the divine embrace. We must become the All in order to be one with the One. And it is important to notice how we leave the intelligible world for the final union and what happens when we do. In the long passage near the end of his treatise *How the Multitude of the Forms came into Being and on the Good* in which he makes his greatest effort to relate his experience<sup>23</sup>, he explains that our union is a perfect assimilation to the eternal union which the Intellect which is the intelligible world enjoys with the Good in the "loving", "mad", "drunken" state which timelessly co-exists with its "thinking" state. We are "carried out of ourselves by the very surge of the wave of Intellect"<sup>24</sup>. If we are to speak of "ecstasy", a term of which Plotinus is not fond, it is an ecstasy of the whole intelligible cosmos by which we are carried out of ourselves who have become the cosmos. It is only when we forget our selves and are no longer aware of our own existence that we forget the Intelligible All: this is obvious when we realise that for Plotinus the self which can rise to the union in which it forgets itself has already become the All. The over-quoted "flight of the alone to the alone" which ends the last treatise of the last *Ennead*<sup>25</sup> (perhaps over-quoted because it is so very easy to find) is misleading if it induces us to think that there is any stage in the ascent of the soul according to Plotinus when it stands isolated, apart from the whole, aware only of itself and God. The "Cut away everything"<sup>26</sup> which ends another great mystical passage gives a more accurate impression: everything must be discarded, including any sort of self-awareness, all at once at that last moment, but only at that last moment. It has often been remarked that the mysticism of Plotinus is totally non-ecclesiastical and non-sacramental, and in that sense non-communitarian. But it is not the mysticism of a solitary saint who seeks God in conscious separation from the worlds of sense and intellect and finds him, apparently, without any participation in an universal movement of return. According to Plotinus we seek God by enlarging ourselves to unity with all that he brings into being and find him and leave all else for him only after and because of that enlargement. We are unlikely

to be able to follow him altogether uncritically at this, any more than at any other, point in his thought. But if we study what he says about the way to the Good which he followed to the end, those of us who are religiously inclined, and perhaps some who are not so, may find that he has a good deal to teach us.

## Is Plotinian Mysticism Monistic?

by Plato Mamo

*The University of Calgary*

Many commentators of Plotinus have been concerned to show that his mysticism is not of the Oriental "monistic" type. The latest is Professor Rist in his book *Plotinus*.<sup>1</sup> Rist adopts the distinction between monistic and theistic mysticism that he found in Zaehner<sup>2</sup> and, one may add, in a number of other writers as well. He then concludes that Plotinian mysticism is of the theistic type and not monistic or pantheistic.

In this paper I wish to defend a monistic interpretation of Plotinus. I shall begin by a very brief attempt to clarify the issue. I shall then offer an interpretation of the mystical passages and a consideration of some of the arguments advanced by opponents of this interpretation, mainly Arnou and Rist. Finally, I shall briefly consider one of the difficulties generated by the monistic interpretation.

Mysticism refers primarily to a kind of experience the chief characteristics of which can be stated, though the experience itself cannot be described adequately. These characteristics are: a) a fusion of cognition and feeling—the subject both knows and is in a state of bliss; b) what he knows is not a determinate entity but rather the "ground", the transcendent source, the formless; c) the mystic knows in no ordinary way but by being united with, assimilated to the object of his vision. He claims that he ceases to be a separate individual and becomes united, "oned", etc. This is the so-called *unio mystica*.

But mysticism may also refer to an attempt at philosophical interpretation of the experience, an attempt to render the strange claims of those who have had it intelligible within a larger metaphysical framework.<sup>3</sup> It is this philosophical mysti-

cism that characterizes Plotinus' work and sets him apart from countless other mystics both eastern and western. It is in this sense that we may ask the question whether his mysticism was monistic or theistic. And clearly the answer to that question will have important implications for the rest of his metaphysics.

Next it might be necessary to say something about the terms monism, theism and pantheism. If the pantheist wishes to claim that the divine is identical with the material world, that "the One and matter are identical and that there is a reconciliation of good and evil",<sup>4</sup> then clearly Plotinus is no pantheist and Rist is right in dismissing that interpretation. Whether it is necessary to understand pantheism in this narrow sense is, of course, another matter. However, let us dismiss pantheism in order to concentrate on monism and theism.

Rist supposes that monism means the absolute identity of the soul with its source, i.e. the One. He supposes that for the monist the separate self is nothing but illusion and that the typical monistic mystic's utterance is "I am God". Following Zaehner, Rist takes the Vedanta as the paradigm of monistic mysticism and then claims that Plotinus, who, as a rule, is very cautious even in the most intensely mystical passages, is no Vedantic mystic and, therefore, he must be a theistic one. There is, presumably, no need to define "theistic mystic". Most Christians and many Christian commentators of Plotinus begin from a premise which is, *prima facie*, opposed to the mystical claims. For them there is always the gap between creator and creature; any talk of the creature becoming the creator is, of necessity, nonsense or heresy. Hence when the mystic claims to be 'oned' with God this must be understood dualistically, i.e. in a way that preserves the integrity of the two spiritual substances: God and the soul. The union then becomes one of contemplation, similarity, love, anything short of absorption. The mystic who, in his interpretation of the experience, follows this Christian metaphysical principle is a theistic mystic. The mystic who talks, seriously, of absorption and loss of the self is a monist. But Plotinus, we are told, is no monist because he does not stress the *absolute* identity of God and soul; *ergo* he is a theist.

It seems to me that placing Plotinus under one or the other of these categories may have some alleged advantages, e.g. it may enable someone to proclaim Plotinus free of the error of monism, but that on the whole it is both pointless and misleading. Indeed, it may be a serious obstacle to the full understanding and appreciation of Plotinus' mystical thought. If, after the latter has been investigated and understood, we need a label then, I submit, monism is more appropriate and less misleading. But to attempt to gain an insight *via* the label seems foolish.

What then is the correct account of Plotinian mysticism? Two basic principles must be recognized. In the first place, everyone who has read Plotinus realizes that his supreme principle is both immanent *and* transcendent. Hence Plotinus cannot be a rigid monist in the sense in which Zaehner speaks of, e.g. Vedantic monism. The transcendent One is the source and origin of all things; it is not identical with them. Nor is there any suggestion that the multiplicity of forms, in all their marvellous diversity, is nothing but illusion.

Secondly, if the supreme is immanent, it cannot be a creator or even a cause in any ordinary sense. This is why Plotinus uses his well-known metaphors: the sun, the root, the spring. Further, the human soul appears to be endowed with extraordinary mobility, as commentators have noted.<sup>5</sup> Indeed, the whole system of the hypostases seems to be a projection of subjective experience and so Plotinus is accused of erecting metaphysics upon psychology.<sup>6</sup> And, as if even this mobility of the soul were not enough to guarantee the essential fluidity and continuity of Plotinian reality, he is the first to distinguish between soul and the *ego* (*ἡμεῖς*)<sup>7</sup> and the first to be wholly concerned with the conscious individual.<sup>8</sup> And this ego is clearly not tied to the physical entity, the person. It is, as it was recognized long ago,<sup>9</sup> a focus of consciousness. A study of the doctrine of the ego in the *Enneads* will reveal several distinct stages or foci running through the chain of realities up to the transcendent One. It is as if Plotinus, having given an account of the emergence of forms from the "beyond" (*ἐπέκτω*) and the emergence of the cosmos from the forms, essentially a Platonic, formalist account, now wishes to supplement it with a

postulate that would do justice to his own experience as a mystic. This postulate, the ego, contains all the dynamism, the continuity, the "boiling life" that is so characteristic of Plotinian reality, and enables Plotinus to maintain the ultimate identity of the self with its ground; while his more formal system of hypostases enables him to assert the permanence and reality of individual men.

Thus the proper way to appreciate Plotinus' monism is not to deny the transcendence of the One (indeed no mystic can do that, in spite of Zaehner's unsympathetic comments) but to understand it in a *mystical* sense; in a way that is compatible with its immanence. True, the source is beyond the world and there is, in a sense, "otherness" between it and all other things.<sup>10</sup> But Plotinus often says that nothing is cut off and we certainly are not cut off from the One.<sup>11</sup> It is this continuity of the tree with the root which makes possible the mystical "leading up," (*ἀνεγωγή*) provided one's consciousness becomes wholly purified and simplified and all form, including otherness, is put away.

This *ἀναγωγή* is, I think, a very important notion which has not received the attention it deserves. It is a thoroughly mystical notion based on the experience of the ascent and the fluid character of the self. It is opposed to a descriptive, formalist metaphysics where "everything", to use Butler's phrase, "is what it is and not another thing". It contains an echo of Heraklitus' unsuccessful search for the limits of the soul. Neglecting this notion, and the mystical continuity it presupposes, has led some people to assert that the higher self reaches only as far as the higher reaches of the Soul and does not extend to the *Nous*.<sup>12</sup> though Plotinus says, "if I and everyone else go back to the intelligible the principle of each will be there." (*εἰ ἐγὼ καὶ ἕκαστος τὴν ἀναγωγὴν ἐπὶ τὸ ὀνητὸν ἔχει, καὶ ἐκάστου ἡ ἀρχὴ ἐκεῖ*).<sup>13</sup> It may be said that in this passage the "There" (*ἐκεῖ*) is the *Nous* and, therefore, this *ἀναγωγή* is irrelevant to our question. But it is not possible that when Plotinus speaks of simplification (*ἀπλῶσις*) and ecstasy (*ἔκστασις*) and becoming another (*ἄλλος γενόμενος*) he is not thinking of the same *ἀναγωγή* which has finally reached beyond the realm of being and where there is coincidence, i.e.

identity of centers. On this level too, neglecting the notion of *ἀναγωγή* causes a curious distortion analogous to Armstrong's demotion of the ego. It is the conception we find in Arnou and repeated by Rist that the soul and the One are "two spiritual substances" and that the mystical union is a contact between two such substances.<sup>14</sup> If one begins with this view of the matter, natural as this is for a Christian, the mystical oneness will become an insuperable difficulty. How can two substances, each ontologically self-sufficient, possessing its own limits, *unite* without blending or without the annihilation of the self which the theist fears? But in Plotinus' view the One is no "spiritual substance"<sup>15</sup> and the soul of the mystic is hardly that: we are here speaking of the going back to one's origin, we have reached the intelligible archetype, we *are* forms (*ἄτοσσωκράτης*). It is this noetic self that has the access to the ultimate principle (*ἀρχή*): not the limited, ordinary substance that is Socrates here.

Indeed the image which most aptly expresses the mystical union is not the sexual contact but the one occurring in the *Tao Te Ching*: "A retreat to one's roots" and the fine Plotinian verse by Yeats "Now I may wither into the Truth."<sup>16</sup> The great monistic image is, of course, the river losing name and shape in the sea.<sup>17</sup> Though Plotinus does not use it, it would be appropriate, as the sea is the source of the river to which the river returns. Better still would be the image of the stream being gathered back into the spring. Clearly this situation could not be described as the union of two substances, and much less as a contact between two substances. It would be a return to our fatherland or to the father.<sup>18</sup>

It is these images of being gathered and being scattered,<sup>19</sup> which are so strangely apt when applied to our conscious life, that best characterize Plotinian reality. And it is the notion of the self operating in this dynamic reality that enables Plotinus to tackle the mystical problem *par excellence*: how the finite, limited self can become the transcendent One. Among the commentators, Trouillard has best appreciated this mobility and "poly-valence" of the ego. "It would be easier to enclose the subject in a situation, a nature or a perspective. But this would be making spirit into a thing... Thus the ego oscillates endlessly."<sup>20</sup>

There is then no question of the identity of what seemed to be two substances so that only the One truly exists. Nor is it a question of a magical transformation of the finite into the infinite. The ordinary ego can be surpassed in noetic activity without the cessation of the lower psychic activities. So too the noetic ego can be transcended in the mystical ecstasy without the destruction of its formal counterpart, the Socrates-himself, (*Ἀποσωκράτης*). At the moment of "union" there is no consciousness of any form, not even the otherness that normally distinguishes the One from the *Nous*. *Qua* self the spiritual reality has become identical with the One. *Qua* a certain formal personality principle it is eternally emanating from the One and is, therefore, distinct.

But although the question of Plotinian monism can best be discussed within these two approaches, the static and the dynamic, we should not try to press this distinction.<sup>21</sup> For it is then too tempting to say that Plotinus' monism appears in the dynamic, "religious" account, while his usual metaphysical account is dualistic. Indeed there is the opinion that what saves Plotinian ecstasy from being monistic is just this distinction between noetic and ontic identity. The soul of the mystic cannot become identical with the One by "nature"; though noetically the One fills it and the mystic is no longer conscious of himself.<sup>22</sup> But I cannot believe that this is a Plotinian view. Those who accuse him of doing psychology under the guise of metaphysics are more nearly right. In Plotinus it is very difficult, as Trouillard remarks<sup>23</sup>, to distinguish the noetic from the ontic and especially so at this level.

The reason for this is that the true background of Plotinus' mystical idealism is, as is recognized now,<sup>24</sup> the Aristotelian doctrine that the mind becomes the object of cognition. This doctrine of "the soul becoming all things" is a typically mystical conception and leads directly to deification and to a monopsychism of the Plotinian kind.<sup>25</sup> Plotinus adopts it and combines it with his own psychological notion of attention, turning, looking at, so that he is able to say, "we are what we desire and what we look at"<sup>26</sup> and there is no indication that the "being and becoming" (*εἶναι καὶ γίγνεσθαι*) is meant only noetically. The distinction between the nature and the noetic level of the

subject is misapplied here. The soul is not an individual thing having a stable nature. "Soul" is a label for a variety of psychic and intellectual activities characterized by a 'scattering' in time. When consciousness returns to the stage of pure *noesis* it is no longer soul, it has become *Nous*.<sup>27</sup> The nature of the subject is precisely determined by the noetic stage. Having been established in the divine *Nous* we are no longer men.<sup>28</sup>

If there is a distinction between the oscillating, noetic self, and some stable nature, it must be between the ego (*ἡμεῖς*) and the only permanent *being* corresponding to the individual man, *viz.* his form in the *Nous*. I have argued elsewhere that we must continue to read Plotinus as indeed positing forms of individual men.<sup>29</sup> Moreover, such forms, like all residents of the *Nous*, must be minds themselves<sup>30</sup> and hence potential egos. Yet even here it seems unplotinian to say that by nature Socrates persists though his mind is totally filled with the One. A nature which is not also a phase of consciousness is contrary to the basic premises of Neoplatonism. Perhaps the answer does lie in the way this superhuman mind of Socrates-himself is conceived. Without pressing the distinction between real and mental reality we can speak of this mind *qua* a certain ideal personality type, the form Socrateity; and also *qua* ego, the fluctuating focus which can sink below the level of *Nous* and even become an individual soul without, however, destroying the eternal form, nor this higher ego which is "ours" whenever we choose to recover it. In the same way, *qua* focus of consciousness, the ego can surpass the ideal Socrateity without destroying or obliterating it. But while the form persists, Socrates does not survive. His experience defines the level of his existence and now, when he sees the formless, he becomes another and not himself (*ἄλλος γινόμενος καὶ οὐκ αὐτός*). The self is obliterated, as all mystics report, though the form is always there to receive it at its first turning away from total unity.

If this is so, then we cannot say, as Zaehner does, that since the soul of the mystic has survived the encounter, the experience of absorption was an illusion, nor that the self survives by nature, nor that some existential otherness remains at the very moment of union. It is not the soul or the ordinary ego that survives. The ego, even the ego established in the *Nous*, is

lost; since the idea of an ego remaining in the absence of all multiplicity and differentiation is unintelligible. What remains is the admittedly strange notion of a mind whose formal and intelligible structure is still intact (and still known by all other form-minds) but whose normal self-awareness is lacking because it is now "a mind senseless and in love" (*νοῦς ἄφρων καὶ ἐρῶν*). In this qualified sense Socrates has ceased to be himself and has become one with his transcendent source. And if this is a possible account then it would not seem inappropriate to call Plotinus a monist while it would be at least misleading to call him a dualist or theist. The latter would imply a radical otherness between the individual substance and the One.

An interesting indication that this kind of qualified monism is not alien to Plotinus' thought is the fact that when Plotinus asks himself: "How is it that I descend again after the vision?"<sup>31</sup> he does not give the answer that would occur immediately to a theist: *viz.* "God filled my soul but I was the same me all along"; or, "I was there noetically though existentially and really I was still a man." Instead he goes on to talk about the descent of all souls in terms of change of attention, desire to be independent, etc. The psychological question coincides with the metaphysical question of the descent of souls. And what this whole account of the "emancipation" of souls comes to, is just the principle that existential otherness depends on noetic otherness. Ecstasy, far from being an illusion, is a cosmic event. The return is not a temporal event in the history of this person. It is an instance of cosmic emanation, the self-differentiation of the ground. The unfolding history of this person is, as it were, the event of his separation. And the return? "Put away everything" (*Ἀφελε πάντα*).

It would also seem that the majority of the texts where Plotinus mentions the mystical experience, give the impression, at least *prima facie*, that the union involves a coincidence and a coalescence. "In his interpretation of the experience Plotinus is nearer to some Indian mystics than he is to the orthodox Christian view."<sup>32</sup> These texts are well known and there is no need to quote them here. Time after time, the Platonic vision (*θεωρία*, *θέα*) locutions are corrected by the images of contact, touch, and often enough by term like, "union" (*ἔνωσις*) "simplification" (*ἀπλῶσις*), "the two become one" (*τὰ δύο ἐν γίγνεται*).

Nevertheless, Arnou, Rist and others have detected a certain dualism in the language used to describe the union. Plotinus, it is said, uses words like "being with" (*συνουσία*), "presence" (*παρουσία*) which imply two things and not one, or says clearly that two things become one. For a strict monist, however, the only permissible locution is "I am God." Since Plotinus allows that two beings become united they must persist in their duality. I do not think this is a strong argument. The conclusion clearly does not follow. Even if Plotinus begins by asserting the existence of two things, in view of his own images of being mixed and blended,<sup>34</sup> we cannot conclude that after the union they remain two. The only thing that concepts like "union" and "blending" entail is that there are two things that become blended; not that the blending is, so to speak, ineffective. Similar remarks would apply to Rist's picking the phrase from V.5.8 "Being one *with that* (*ἐκείνῳ*) and not two" and claiming that other monistic phrases should be explained in terms of this. Being one with that and not two only means that there are two things that are being oned; not the contradictory view that they are *still two* but not two. As far as the more general claim that one finds in Zaehner, *viz.* that in monistic mysticism there is no love, or its variant that one finds in Rist, *viz.* that because Plotinus says that one surrenders, or that the soul is filled with God he cannot be a monist, this claim seems to be a mistake. Indeed one loves the absolute; indeed one surrenders to it and not to oneself.<sup>35</sup> But this only means that initially, and for reasons Plotinus never tires of giving, there is a distance between the self and its ground. It does not mean that after the surrender he who surrenders is still the same self, or that he whose soul is filled with God is still the same individual being.

Rist further asserts that the sudden character of the vision "hardly fits the notion of the monistic isolation of the soul"<sup>36</sup> though he does not tell us why. And finally, as if to clinch the case against the monist, he cites the metaphor of the converging centers in VI.9.10 "perhaps the most apt description of all" and curiously claims that, in spite of the coincidence of centers, the metaphor preserves the dualism of otherness. But Plotinus' image, though certainly apt, hardly leaves room for such

dualistic interpretation. The whole chapter is strongly monistic and, he says, "even here when the centers come together they are one" (καὶ γὰρ ἐνταῦθα συνελθόντα ἓν ἐστὶ). And indeed if the centers are points they *must* be one, if they coincide. Rist chooses to talk of dots drawn on paper at different times and implies that though they *seem* one they would still in some sense be *two*.<sup>37</sup> It is not clear in what sense they could be said to be two. Some strange criteria of individuation must be involved here. At any rate Plotinus is speaking of centers not dots and the coincidence of centers, as well as "his center of centers"<sup>38</sup> are powerful images of the final stage in the expansion and simplification of the self: it has become the One.

There are, however, two other linguistic arguments, used by Arnou, and I now turn to them. Arnou is struck by the frequent occurrence of terms meaning generally "as it were" (ὥσπερ, οἶον) and hesitation-expressing phrases, "if we must say this" (εἰ δεῖ καὶ τοῦτο λέγειν) to be found specifically in VI.9.11 and 10 and concludes that the caution is precisely meant by Plotinus to warn us that the union is no fusion but contact.<sup>39</sup> To this it must be replied that: a) There are many monistic passages not qualified by the οἶον, or any other caution term, notably the center-coincidence image of VI.9.10.<sup>40</sup> b) That the οἶον occurs not only when the threat of monism appears but in many other places; whenever, in fact, we try to speak of the ineffable and of our relation to it. This introduces another large problem for any mystical philosophy, and one which Plotinus has constantly in mind: How shall we speak about the ineffable? At least once Plotinus agrees with Wittgenstein that we must be silent.<sup>41</sup> More often he agrees with Heraklitus that we must *indicate*, must use language for the sake of showing (ἐνδείξεως ἕνεκα). Language is necessary though not exact.<sup>42</sup> Therefore, Plotinus says in the same passage, let us take the "as it were" in each case (λαμβάνετω δὲ καὶ τὸ οἶον ἐφ' ἐκάστου). There are very many passages where he follows this advice<sup>43</sup> and very few of them are meant to be qualifications of the monistic character of the union. c) The audacious saying (τολμηρὸς λόγος) can be justified by the paradoxical nature of the phrases used. To say of the man in ecstasy that he is no longer a self is true. But to say he has

become another, is not at all himself, (ἄλλος γινόμενος and οὐδ' ὅλως αὐτός)<sup>44</sup> is something of an exaggeration for it suggests a magical transformation or a sudden disappearance of the self. And that is not strictly correct. For Socrates is not lost just when he becomes established in the supreme. On the contrary, as many mystics say, he has found the true self. Only the limits of being Socrates are lost. So the "not at all himself" does, still, indicate. But then the "if we must say this" (εἰ δεῖ καὶ τοῦτο λέγειν) becomes understandable. And the "audacious saying" goes with "hard-to-express vision" (δύσφραστον τὸ θέαμα). Who would deny that the mystical claims are strange? But, as a little polemical aside, are the theistic claims less strange?

Arnou's second linguistic argument is the fact that Plotinus uses limiting phrases, like "as far as it can" (καθ' ὅσον δύναται). This shows, Arnou claims, that the mystical union does not imply the identity of man and God.<sup>45</sup> And it must be admitted that such phrases are incompatible with the "coincidence" (rather than "identity") view. But the first five passages quoted by Arnou do not refer to the mystical union as such. Of the ones that do, two contain the vision terms<sup>46</sup> and the hesitation may be due to Plotinus' belief that the vision language, Platonic and traditional though it may be, cannot fully express the mystical contact. The third is even less conclusive since it concerns the capacity of *soul* to possess the divine.<sup>47</sup> Moreover, the formula as far as possible (κατὰ τὸ δυνατόν) is another traditional phrase<sup>48</sup> which may have been a serious qualification for Plato but seems to be a mere echo in the few places where Plotinus uses it. Indeed terms like union, simplification, the coincidence of centers, can hardly be subject to the "as far as possible" qualification. The latter seems most appropriate to the vision image since one can see clearly or dimly; but one cannot *coincide* more or less.<sup>49</sup>

I conclude, therefore, that those who point to the text of Plotinus in support of their view that his mysticism is of the theistic variety are unable to find their proof there. The texts themselves create a strong monistic impression; although it is true, of course that the extreme identity phrases, e.g. "I am God" are lacking. But the reason for this is not that Plotinus was a theist; rather, these phrases would strike him as too crude

and inaccurate in view of his own sophisticated notion of the self that can *become* the One only after the most arduous purification and only at the last moment, as it were, of the expansion and simplification of the soul. The phrase "I am God" is apt to be mistaken (and was mistaken, in fact) as the claim that this ordinary man, this pitiful fragment of the cosmos, is the One. But that is madness and megalomania and not what the mystic claims.

Moreover, although Plotinus did not easily dismiss personality<sup>50</sup> to the point of elevating its ideal principle to the *Nous*, he often thinks of individuality (probably a lower manifestation of the formal principle of personality) in terms not unlike those of classical Oriental monism. It was no accident that Bréhier began his 'Orientalism' thesis by quoting VI.5.12. "It is through non-being that you have become someone." And, "you no longer say concerning yourself: this is what I am. Leaving behind the limit you become all. Yet you were the all from the beginning. But as you were something besides, this addition reduced you."<sup>51</sup> This passage can be, I think, reconciled with the doctrine of individual forms. Nevertheless, it is in direct opposition to the theistic requirement that the individual soul, as a spiritual substance, persists and survives the encounter with the One. Here the individuality of the soul comes close to being an illusion, an addition of non-being, clearly something to be overcome before a higher stage in the expansion towards totality (*πᾶς*) can be reached.

It is sometimes said, however, that though Plotinus often speaks as if he were a monist of sorts, he *could not have meant* what he seems to mean because this would create some very serious difficulties within his system. And indeed the position is not free from difficulties even after we make allowances for the fact that it is based on an experience which is beyond our ordinary rational comprehension. If this is to be an argument against the monistic interpretation, one must assume that the theistic interpretation is free from such difficulties. But is there a reason to think that? Let us look at the correct theistic picture as we find it in Rist: "While the soul as a spiritual substance can be enveloped by the One, enraptured, surrendered, wholly characterized so as to become infinite and not

finite (5.8.4.33) it is neither obliterated nor revealed as the One itself, nor as the *only* spiritual substance."<sup>52</sup> I confess that I do not understand the picture. If we are willing to say that the soul *becomes infinite* how can its former identity still remain while enveloped by the infinity of the One? Are there two, or any number of, infinite substances? Wouldn't that which distinguishes them be a limit?

The chief difficulty with the monistic interpretation, on the other hand, is that it seems to place a temporal event (suddenly) at the heart of reality emanating in a non-temporal process. Plotinus says that time begins at the level of soul. If the mystical union is an event in the life of some individual then it cannot reach the higher levels of eternal reality. Plotinus does not deal with this difficulty. Perhaps the mystic cannot fully explain this sudden conversion that lifts him out of the body and the ordinary temporal consciousness. Perhaps it may be said that the static system of hypostases is based on the psychological experience and is secondary to it. Hence the experience of liberation from time is not a shortcut to the One but contains the evidence for the metaphysical schema. Secondly, it may be said that the sudden passing away of multiplicity and temporal succession is not a contradiction but a corroboration of the Plotinian view that time is born with the lower stages of psychic activity. The "suddenly" is not itself a temporal event; it marks, rather, the passage from time to the timelessness of true being. Plotinus, following Plato, does not consider the life of the spirit as static. There is activity, boiling life, *energeia*. Time and change, however, are excluded because they involve a scattering, a weakening of this activity. Hence the recovery of the original view-point, though an "activity", is not a temporal process. Indeed it is the opposite: time has been reduced to its root. A similar account can be given (and is given by Plotinus in IV.8) about the descent. That too is not a temporal event. It is a tendency of the active spirit towards separation that generates time. After the wondrous vision we are puzzled. But the explanation, for the mystic, must lie within the experience itself and not with the demands of a dogma or a metaphysical system—even one of one's own making.

## Plotinus and Moral Obligation

by John M. Rist

*University of Toronto*

In contemporary ethical or meta-ethical discussions the concept of moral obligation looms large. People have even come to talk about the ethics of obligation and to contrast this with the older (frequently Aristotelian or sub-Aristotelian) ethics of virtue. Much is now written about the necessity to disassociate statements of fact from statements of value, or about the impropriety of deducing "ought" from "is". "Ought"—statements are often claimed to be ultimately arbitrary, in that it is in the last resort merely a matter of arbitrary choice what kind of moral code an individual may accept. Thus the only test for the superiority of one set of principles to another would be the consistency or lack of consistency each code could exhibit. Attempts are made, of course, to evade this apparently unpopular conclusion by distinguishing hypothetical and categorical imperatives. Thus "If you want to catch the train, you ought to run faster" is separated from "You ought not to kill". But to the objection "Why ought I not to kill?", the only answers seem to be either "You just ought not" — which does not get us very far philosophically — or "You ought not to because killing is a bad thing" — which makes us wonder how we know what bad things are — not to speak of the logical relations between "x is bad" and "I ought not to do x", or the logical grammar of "If you want to do x or be F, you ought not to kill" (If you want to be safe from the police, have a good conscience, be allowed to get on with your work, not spend five years in jail. . .etc.). Though I obviously cannot argue it here, the point I would want to make is that the so-called categorical imperative, if it is to be categorical and not a disguised hypothetical, is arbitrary. It is the realization of this that has made many post-Kantian ethical writers admit that their concern is with the form, not the content of ethical systems. If someone advocates what is commonly regarded as an immoral doctrine, we may hear it said that it is not worth talking to him;

just make sure you don't go near him when you want to buy a second-hand car.

In contrast to philosophers of the type we have mentioned Plotinus is not particularly concerned to tell us directly what we ought to do, still less what it means to use the word "ought". The moral "ought" seems to be rather uncommon in the *Enneads*. Of course, there are examples. If a man is in great pain, he will consider what he ought to do, i.e. whether he ought to commit suicide (I.4.8.8). Suicide is the subject again in another example (I.9.19); a man ought not to take himself out of life so long as there is any possibility of moral improvement.<sup>1</sup> Another example occurs at the end of *Ennead* VI.6.1. Plotinus is concerned first with the question whether one ought not to commit murder, then with whether one ought to know that one ought not to commit murder (VI.8.1.42-44). A final example of a more general kind is for that reason perhaps more generally informative (VI.8.6.16). In this passage the word "ought" does not occur. Instead we have the form of an indirect command: virtue (sometimes) commands a man to lay down his life, and to give up possessions, children and country. Plotinus is saying that according to the dictates of virtue this is the path which should be followed; these are the things which ought to be done. But these examples are not typical material from the *Enneads*. Plotinus has remarkably little to say about what we ought to do.

Of course, it does not follow that he is unconcerned with what ought to be done or thinks it of little importance. Because he has no formal discussion of moral obligation, we should not assume that the concept does not appear in another guise – and even widely – in the *Enneads*. What we must assume is that the whole question is approached in different ways, and we may wonder whether he would judge our use of the term "moral obligation" and our frequent identification of the nature of the moral "ought" misleading. For Plotinus, as for Plato, Aristotle and the Stoics, the good life is a life of virtue and virtue is a state of the soul. Without such a virtuous condition all hope of progress towards God is vain. Objecting strongly to Gnostic antinomianism Plotinus comments that without virtue God is just a name (II.9.15.40); those who use it without virtue are misguided if not hypocritical.

An *Ennead* I.2 makes clear, the Neoplatonic manner of handling the question of the virtues is to see them as a progression. Plotinus is less systematic about this than some of his successors,<sup>2</sup> but he proposes a distinction between the so-called civic virtues – those treated by Plato in the *Republic* (427E-434D) – and the virtues of purification, i.e. those virtues which exist in the soul when it is purified (I.2.7.9). Purification is viewed as a means of freeing the soul from the passions and desires of the body and indeed a separation (*χωρίζειν*) of the soul from the body as far as possible (I.2.4.5-6). The opening sentences of *Ennead* I.2 draw our attention to the text of the *Theaetetus* (176AB) where Plato speaks of escaping the evil "of this place" and becoming godlike. In practice, this works out to be the process of separating the soul from bodily concerns, and its ultimate identification with *Nous* and conversion to the One.<sup>3</sup> It is, as Plotinus will emphasize again and again throughout the whole of the *Enneads*, a process of freeing the soul, of enabling it to engage in its natural and proper activity. Before looking at the question of how virtue and the free condition of the soul must be related to questions of moral obligation, it will be necessary to pause briefly over some of the material, in *Ennead* VI.8 in particular, on the freedom of the soul itself.

Plotinus begins in VI.8.1 by taking up the traditional question of what is in our power (*τὸ ἐφ' ἡμῶν*). He quickly identifies a voluntary act (*ἐκούσιον*) as an act which we perform under no external compulsion and on an occasion when we know what we are doing. In contrast to this, perhaps, what we are in control of doing (*κύριοι πράξει*) need not involve knowledge of what we are doing. A man who kills his father without realizing whom he is killing is in control of the action of killing his father, but his action is not voluntary. But what about a man who does not know that murder is wrong? Can he legitimately claim that his killing someone is not a voluntary action? Ought he to have known about the morality of homicide? At any rate the problem of being able to perform a voluntary act is already associated in Plotinus' mind with a variety of knowledge.

VI.8.2 introduces us to so-called "internal" constraints. How can we be said to be really in control of our acts (*κύριοι*)

when we act under the impulse of fury or lust. It won't do, after all, to say that we are in control of everything we do, and *thus* that all our actions are in our power. If we say that, then not only is there no such thing as *human* action, but even "soulless" substances like fire can be said to be free (If fire burns, it burns freely — a paradoxical conclusion which Plotinus will not toy with). Nor is the mere awareness (*αἰσθησις*) of an act a test of whether it is an act under our control. To be aware of doing something does not imply to be in control of that action. There must be occasions when reason or knowledge (*λόγος, γνῶσις*) is in command (*κράτει*) and independent of desire (*ὀρεξις*). So there is a knowledge implying action which combats a *desire* to act otherwise; and when we are "in control", such knowledge must be in control. Knowledge is thus distinguished from awareness; it is an *élan*, a drive to *act* rationally. Plotinus' distinction between awareness and knowledge has some resemblances to Newman's distinction between notional and real assent.<sup>4</sup>

VI.8.3 sums up progress thus far, but there are confusing changes of terminology. If we want to know what is in our power (*τὸ ἐφ' ἡμῶν*), we must consider our will (*βούλησις*) — and willing must be understood in terms of reasoning and knowledge. If knowledge is not there, we may be drawn to the right course, to doing what we ought (*πρὸς τὸ δεῖον ἀχθεῖς*) by chance or through a set of reflections deriving entirely from bodily conditions such as hunger, thirst, or too much semen. People who are impelled to act by these motivating factors cannot properly be said to be performing free acts (*τὸ αὐτεξούσιον*). Free action then is not simply what one does, once again, but what one knows is the proper action. Proposals emanating from *Nous* are free, and action in accordance with them is "in our power" in the strict sense. We come thus close to a definition of free action. It is the action of *Nous* — and therefore the only possible action for the gods. It follows that in so far as our action is in accordance with what is true and known to be true, it is free action. So no one is free when he acts badly. When he is unable to do what is good, we may assume, he is incapable of free action; when he is able to do what is good, he is free.

So far Plotinus has argued that free action cannot be governed by external pressures or by bodily appetites, and that it must be the result of well-grounded reasoning. He now turns to a further question, a question of importance philosophically, but unfortunately rarely discussed by ancient philosophers (VI.8.4). We admit that action uninfluenced by external forces is motivated by desire for the good,<sup>5</sup> but there is still a desire, and, surely, if a desire, then also a need. That would mean, the objection runs, that the resulting action cannot be regarded as free (*αὐτεξούσιον*). The objection, if it could be sustained, would be serious for Plotinus, for, as he says, it would affect not merely the activity of the soul, but also that of the intellect (*Nous*). The activity of *Nous* could not be free if its acts were governed by its nature. Can an act be called free, Plotinus wonders, if it is impossible not to perform it? He then adds a second, less important query: we must distinguish activity, which is the achievement of all beings, from action (*πράξις*), which seems necessarily to involve lower "substances" than the intellect. Perhaps it is *only* to the activities of such substances that the word "free" should be applied.

Plotinus meets these objections head on. All compulsion, he argues, must involve a compelling factor from "outside". What he seems to mean is that if someone gives way to his desire for a fourth helping of cassata, he is not simply giving away to an *internal* constraint; internal constraints are only operative because of the presence of external constraints. The presence of the cassata is *necessary* to activate the vicious desire. (This may seem unsatisfactory. Perhaps Plotinus is thinking of the presence or the imagined presence of an external agent — but why *should* it be imagined?) But how does all this affect the question of a desire for the good? The good, Plotinus seems to be saying, is in no sense an external. Desire for the good is not desire for something outside the subject, but the activity of a subject in so far as it exists. Thus any impulse towards the real and fully recognized good has to result in free action. Free action, natural action and good action thus coincide.

Plotinus takes the opportunity now presented to him to offer a further analysis of the concept of "being a slave of one's

own nature" (VI.8.4.22-23). Where we can make a distinction between potentiality and actuality, he observes, we can distinguish between that which obeys and that which is obeyed. But where there is no potentiality the distinction is merely verbal. Thus, apparently, in the case of a being in simple act, (e.g. *Nous*), to say that it obeys its own nature is to say that its nature and the activity it achieves are one. Here again we see the dynamic Plotinian conception of knowledge, the view of *Nous* as an élan and as a drive to act rationally, not as a relation between a mind and a (Platonic?) object of knowledge. As Plotinus puts it, being and act are identical (VI.8.4.28). Perhaps reference to what is in one's power (τὸ ἐφ' ἡμῶν) is inappropriate to this stage, he adds, though he has not rejected the word "free" (ἐλευθέρᾳ), for to say that something is in one's power is to speak negatively; it is to refer to being free from compulsion where compulsion properly indicates an external pressure. So he concludes the chapter by repeating himself once: gain – necessarily, for the point does not seem to be readily grasped: freedom is the ability to operate for the sake of the good (τοῦ ἀγαθοῦ χάριν).

It will obviously follow from our argument up to this point that to ask "Ought *Nous* to act in such and such a way?", would be misleading. *Nous* will do what it ought to do because it is able to do what it ought to do. But should we say "*Nous* will do what it ought to do" rather than "*Nous* will do what is good?" Perhaps the latter is the more appropriate if we are to say that an "ought" only arises where there is the possibility of a subject *not* doing what is good. Thus "ought" would imply "can but will not necessarily". The term, if that is the usage, would therefore only be applicable at the level of human behaviour, not to any activity higher in the scale of reality. To put it succinctly, though somewhat paradoxically: where there is freedom, there is no need for a sense of moral obligation. A sense of moral obligation is necessary and exists where the possibility of vicious action exists.

*Ennead* VI.8.5 brings us back to such possibilities. The chapter opens, as frequently enough, by posing a further question. We have now defined freedom (τὸ ἀντρεξούσιον) as a feature of *Nous* qua *Nous*. Does that mean that the term is

inapplicable at any other level? If it has wider application, does it apply to the soul when it acts "in accordance with *Nous*" and when it behaves "in accordance with virtue"? Obviously "virtue" here refers to the best action possible for the soul. Such action is "in accordance with *Nous*" and thus, as we have suggested, will be free action where the notion of moral obligation is inapplicable. If our approach is correct, we should find that the notion of a choice between good and evil will disappear from the virtuous soul. And if moral obligation is supposed to imply an awareness of what we ought to do coupled with the possibility of not being able to do it, such a sense of obligation will disappear from the soul in so far as it becomes more perfectly virtuous.

Clearly in one sense the soul is constrained, and thus "we" are constrained, by external circumstances in a way in which *Nous* is not – and in so far as we are constrained, we are not "free" to act. What we are able to *achieve* does not depend solely on ourselves, for although we may make choices and decisions, and though we may act accordingly, we are not in full control (κύριοι) of events. When we act bravely in battle, the performance of our act depends on the existence of the circumstances which call it forth.<sup>6</sup> All specific moral acts are restricted in this way. So if virtue requires such opportunities (and Aristotle certainly thinks that some – if not all – the moral virtues do), then such virtue is not "free" in the sense with which Plotinus has been concerned in *Ennead* VI.8. And Plotinus will grant that "freedom" must apply to activity, not merely to wanting and reasoning that is designed to lead to activity. Freedom, it seems, cannot be merely a matter of intention and purity of motive. Many actions, even when performed morally and well, can never be free. In fact, all everyday moral behaviour falls into this class; at its best it is "semi-free". All of it exhibits the feature of being constrained by some kind of external pressure. Thus in every case the possibility of the good not being accomplished is real and, it presumably follows, in all such cases it will be appropriate for a man to tell himself, and to tell other people, what he ought to do. When we are in the realm of moral obligation, we are not yet in the realm of virtue. Virtue is "another *Nous*" and, strictly

speaking, as the last lines of VI.8.5 indicate, it is outside physical acts and events in time.

The consequences of the arguments we have outlined are drawn in VI.8.6. In so far as a man is living the good life, the life of *Nous* and the life of virtue, his moral acts will be dictated by his virtue, by his *Nous*. Virtue will tell him if he is to sacrifice his goods or his life. A sense of moral obligation may be viewed as a sense of what is right; it is possessed by anyone trying to live in obedience to that element in him or over him which is already living the life of virtue. The claims of a moral obligation, e.g. the need for self sacrifice, will be respected and obeyed in so far as a man has elevated himself to the level of *Nous*. Presumably in the man who has made the most moral progress the sense of obligation will be called upon the least, in that his disposition will be the most free, and he will be the most likely to do what is good as a matter of course, or, in Plotinian language, as a matter of nature. One may suppose, as we have seen, that as virtue becomes more and more identified with a man's character, so his sense of obligation, hitherto necessary, will wither away and be no longer needed.

It is clear then why we hear so little in the *Enneads* about a sense of obligation. The possession of such a state, in the Plotinian scheme, is to be associated with that stage of development at which a man is choosing between right and wrong. It is a stage at which he is still no longer free; his nature, distorted by bodily desires and impulses, cannot follow its natural bent. His "will" to good is thwarted and he still has to struggle to keep himself on the right path. By implication criticising the Stoics and their doctrine of the right act done from pure motives, Plotinus observes in 1.2.5.28-6.2 that one stage of the elevation of the soul is attained when the passions are obedient to reason, when *acrasia*, that is, the overcoming of the reason by desires and impulses of a non-rational character, is out of the question. At this stage, says Plotinus, we do not sin, all our action is right action (*καθόρθωσις*). Nevertheless, *pace* the Stoics, our aim is higher than that: our aim is not merely to be "outside sin"; it is of a positive kind, or, as Plotinus puts it, "to be god" (*θεὸν εἶναι*). To consider exactly what this means would be to digress, but Plotinus certainly wants to point out

that his view of right action involves not the *avoidance* (presumably by a correct and rightly motivated choice among alternatives) of wrong-doing, but a state of soul which will be unchanging and fixed. For if *θεός* means anything precise, it means something unchanging and eternally the same. It is apparently often used to indicate the unchanging *quality* of a subject rather than as the name of a subject itself.

The approach we have adopted runs into certain other problems of vocabulary which should be removed from the path if possible. At 1.2.6.14 (1.2 is 19 in Porphyry's chronological list) it is said that virtue does not exist at the level of *Nous*, whereas the opposite view is taken at VI.8.6.5 (chronologically 39). But different uses of the term "virtue" may be seen in different contexts. Aristotle, in the *Nicomachean Ethics*, denies virtuous conduct (acting bravely, liberally, etc.) to the gods,<sup>7</sup> and the moral virtue of the *Nicomachean Ethics* forms one of the bases of *Ennead* 1.2. On the other hand, although Aristotle's thought about free will is one of the sources of Plotinus' discussion of the topic in the early chapters of 6.8, the use of terms in VI.8 must not be assumed to be identical with that of 1.2 simply because both have an Aristotelian base. Plotinus wrote the two treatises several years apart; it is unhelpful to attempt to identify differences of philosophical position or a development of the theory of virtue on the basis of Plotinus' somewhat slap-happy employment of terms which we vainly wish were technical.

Let us pull some threads together. For Plotinus we may assume that a thing exists insofar as it is good -- and I am using "exists" in the strong Platonic sense of existing in an unchanging and imperishable form. In so far as things are not good, i.e. are not characterized by the presence, direct or indirect, of the One or Good, they do not exist in this Plotinian sense. Hence Plotinus will say that unless distracting influences or negative forces are at work, each being will act "for the sake of the good or of its good".<sup>8</sup> Such action for the sake of the good is the free (i.e. unimpeded) action of a substance. "Unfree" action will therefore be action tending to the destruction of the substance, animate or inanimate, which performs it. In fact, as we have

already noticed, Plotinus normally limits the concept of the unfree to the activities of animate substances.

We have observed already that statements in the form "You ought not to do x" must often be filled out either as "You ought not to do x because of y", or, "You ought not to do x if you want to achieve z". When dealing with statements about so-called moral obligations Plotinus would undoubtedly wish to follow a procedure of this sort. How does it work out in practice? The implication is that "You ought (morally) to do x" must be rephrased as "If you want to become better, freer, closer to the good, etc., you should do x". In one sense, therefore, there is no notion of obligation at all. It is up to each man to choose what he wants to do. If he wants to act viciously, let him do so, but it is the job of the moralist (and of the philosopher) to point out exactly what he is doing. Hence a so-called moral obligation and perhaps even a sense of moral obligation, will arise if he chooses to try to act freely in the Plotinian sense. When he has succeeded in accomplishing such an action, i.e. when he has raised himself to the level of *Nous*, moral obligation will no longer present itself to him as obligation. He will simply act "rightly".

If the Aristotelian commentator Elias does not misrepresent Plotinus' thought, we can check up on an interesting example of the way Plotinian language about right action works; we can look at the end of *Ennead* I.9 and compare it with Elias' quotation of Plotinus' writing on "rational departure", i.e. suicide.<sup>9</sup> *Ennead* I.9 ends as follows: If each man's soul in the other world depends on its condition when he leaves this one, we ought not to commit suicide when there is any chance of improvement. Elias' quotation closes as follows: It is disordered (*ἀτοπον*) to take oneself out of life before the right moment when he who has bound the body to the soul looses them again. We notice the approach I have already pointed out in the first passage: if such and such is the case (and if by implication we are interested in benefitting ourselves in the next world), then we ought to do x. It is assumed that we want to benefit ourselves in the next world, and the "ought" is used with reference to how such benefits can be achieved. The point is that it is held to be absurd and irrational not to wish for such

a result. This is brought out in the passage from Elias. Here, instead of saying, "We *ought* not to commit suicide and anticipate God in separating soul from body", Plotinus claims that to do so would be disordered or untoward (*ἀτοπον*). The juxtaposition of the two passages gives us a clear example of the way the implications of the concept of freedom are worked out: what we ought to do (in Plotinus' opinion) is simply what it is rational to do. Thus it follows that the best sort of moral obligation can be understood only as a call to act rationally. If anyone asks why we should do what we ought, he can be told that, since his question implies that good reasons for action should be accepted, he should not cavil at acting in accordance with Plotinus' moral "ought", since it is translatable into a call for rationality.

Plotinus would be gratified to hear that much of the theory we have attributed to him is implicit in Plato's *Republic*. No one would deny that in that dialogue Plato is advocating a particular way of life, a particular tending of the soul, a particular kind of behaviour. The philosopher-king is a pattern we should all strive to resemble. But there are few places in the *Republic* where Plato tells us what we ought to do; he tells us rather what the philosopher-king would do. One example is particularly instructive: the philosopher must return to the Cave (*Republic* 520C1) because it is just for him to do so. Since he is just, he will do what is just. It is Glaucon, who is certainly not a philosopher-king, who imagines that there will be some conflict in the philosopher's mind and that he will, if he returns to the Cave, have to live a worse life instead of a better. According to Socrates, however, the philosopher-king will simply do what is right. His actions and his obligations will always coincide, because he is that sort of man.

But when addressing his readers, Plato does not give them a series of moral commands, nor point to a set of categorical imperatives. Let us consider again the methodology of the *Republic*: to the irritation of those who expect it to take the form of deduction and refutation, it is an exercise in portraiture. Although Socrates goes through a form of refutation of Thrasymachus in Book I, he does not treat the objections of Glaucon and Adeimantus in the same way; instead he offers two

portraits, one of the philosopher-king, and the other of the tyrant. He supposes that these pictures represent what we may call the good and the bad life in their starkest form. He invites us to choose which we would prefer for ourselves; he does not bring in the question of rewards and punishments in another life until we have made our choice on the basis of what we would prefer and find expedient in this world alone. He does not tell us we ought not to behave tyrannically, but that if we behave tyrannically we shall be people of particular (in his view unpleasant) dispositions. So we are invited to check empirically whether his characterizations of the virtuous and vicious answer to the facts as we can see them if we look at the world realistically and honestly.

All this is implicitly taken over by Plotinus. As in Plato, so in Plotinus we are not told what is morally good and what we therefore must (or ought to) choose. All kinds of codes of behavior are possible, and there is a sense in which it is a matter for free (even arbitrary) choice which code one selects or which code one lives by. There is no word in Plotinian Greek which exactly translates the English "morality" — though *σπουδαῖος* or *ἐπιεικής* are both something like our "morally good" — but there is no reason why Plotinus could not accept that morality is simply a formal term, i.e. that it refers to any (hopefully consistent) code of behaviour freely adopted by an individual man. That is not, of course, to assert that Plotinus would agree that any morality is as good as any other; he thinks that codes of behaviour must be judged in terms of their usefulness and expediency for each of us. We do not fix on a code as intrinsically good and then ask ourselves how it can be expedient, or whether and in what sense it is expedient; we allow a rational judgement of expediency to lead us to the discovery of the Good, and therefore of the good for man.

Plotinus' morality, like that of Plato and Aristotle, is eudaimonistic in the sense that the aim is to secure well being or "happiness". And this well being is best secured by a particular kind of life, aimed at a freedom and rationality of the kind we have discussed. If a man is virtuous (*σπουδαῖος*), he has all the requirements for happiness and for acquiring what is good (1.4.4.25). These requirements, as we have seen, are basically

the ability to perform certain kinds of actions which themselves arise from certain dispositions and states of mind. But a eudaimonistic morality can easily be misunderstood. It might appear as though Plotinus were advocating that, if happiness is the good, we therefore have duties or obligations to ourselves, but none to anyone else. That is not the way it turns out. Although Plotinus certainly believes that we have duties to ourselves — and there is no reason why he should not think so if we have duties to other people — he also believes that a search for happiness — and the consequent duties to ourselves which we shall fulfill in so far as we are successful — entails duties and responsibilities to other people. To explain why this should be so would require a full-scale discussion of Plotinus' metaphysics, for which there is obviously no place here. We must content ourselves with noticing that the world is an interconnected whole, and it is impossible to be concerned with the source of happiness, the Good, without being concerned with, and for, the other items, particularly other souls, which are the products of the Good. The theory is summed up at 11.9.16.7ff: "The man who feels affection for something values whatever is akin to the object of his affection; if he loves the father, he loves the children." The theme is necessary and important for Plotinus — and anyone else. Plotinus wants to reject a plea that preoccupation with the divine is inconsistent with a concern for human beings. Concern for human beings implies "virtue" in the normally accepted sense; hence, as we have already observed, Plotinus says elsewhere that virtue (understood here as common decency and ordinary morality) is the first step towards God; without it "God" is a name people mouth (11.9.15.40).

What sort of obligations to others will the philosopher thus wish to carry out? Whatever they are, they will not be carried out grudgingly (*φρόνως ἔξω θεῖου χοροῦ ἴσονται*, *Phaedrus* 247A). There is for Plotinus only a limited amount that we can do for other people. Ultimately each man must face reality for himself (*μόνος πρὸς μόνον*); he cannot find a substitute, anymore than he can find someone to die for him. And what should be done for other people must depend on the possibilities open to them and the choices they have made for themselves about their own lives. Porphyry tells us that Plotinus

devoted a good deal of attention to looking after the property of children whose parents had died and for whom he had been made responsible;<sup>10</sup> they needed the money, he held, unless they should turn to a life of philosophy. But necessary as a fulfillment of such obligations is, for Plotinus the real obligation of a philosopher is to teach. In so far as it is possible, the philosopher must announce (*ἀγγέλλοντα*, VI.9.7.22) the nature of the true relation with the divine.

According to Porphyry Plotinus was a kind man, and there is no reason to reject this testimony. That being so, there are a number of rather harsh sounding passages in the *Enneads* which may be the more informative in so far as they tend to jar liberal sensibilities. Plotinus, like a modern social-worker, is aware that too great an emotional involvement in the misfortunes of those he would like to help will only inhibit his ability to do so. But to say that is not entirely to explain such sections as *Ennead* III.2.8. Let us note a few ideas from this passage: in the gymnasium boys who have kept themselves fit may throw those who have not, and make off with their food and clothes. "Serve them right" is the appropriate reaction — accompanied by a laugh at the expense of the vanquished. The world outside presents a similar scenario: if you don't behave bravely, and in general virtuously, you will be victimized, and deservedly so. "The wicked rule through the cowardice of their subjects; and this is just". It is grotesque to sit around and pray for a good harvest rather than look after the land. The theme is generalized in the next chapter: "It is not right (*θεμιτόν*) that those who have become wicked should expect others to be their saviours and to sacrifice themselves in answer to their prayers" (III. 2.9.10-12). The message of all this is clear: no one should be expected to look after someone else if that person is able but unwilling to look after himself (and he probably would not be able to look after such a person anyway.) Here we see where the limits of obligation are set: Plotinus seems to be concerned to find a way to balance the concept of obligation to others (which is a part of virtue) with the necessity and possibility of people helping themselves. Those who will not swim should be allowed to sink. And this brings us to the final point I want to make.

Plotinus agrees with Aristotle in holding that there are some things which the good man simply will not do. With reference to such cases to say that A ought to do x is to imply that A can do x. (This of course has nothing to do with the wider question whether Plotinus would hold that in *all* uses of the word "ought", "ought" implies "can" — a dogma of much contemporary ethical theory whose weaknesses and difficulties need not be elaborated here.) But why should Plotinus think that there are any cases in morality in which "ought" implies "can"? On what theory of the psyche does such a view depend? For we must remember the way in which the "ought" is to be understood. Plotinus' view, as we have argued, is that "You ought to do x" (which is a morally good act) must be read as "If you want to be a good man, you ought to do x, and it is expedient to be a good man". So we are saying that he also holds that there are some actions for which it will be true to say "If you want (as you do) to be a good man, you are *able* to do x". But one might object, are we *able* to want to be a good man? Or are all our "wants" in this area fixed, innate, determined by social conditions, etc. Plotinus' view is that not only are we able to want to be a good man, but we do in fact want to be a good man — or at least that there is such a "want" in us, this want being the characteristic "movement" and disposition of the pure and unfallen part of the soul, the so-called "upper" soul.<sup>11</sup> But although this theory explains why "we", as distinct from our upper soul, will want to be good, how does it explain that we are able to be good? The fact is that it does not. Plotinus' problem is as follows: he thinks that it is a matter of observation that some men simply will not do certain acts which may be designated as vicious. He assumes that since all men must have in common that which is the highest element in them — an adaptation of Aristotelian doctrines about *Nous* — they must therefore possess this "higher" faculty. Thus all men possess a higher and purer part of the soul. But surely all this shows is that it is *possible* for all men to avoid certain viciousnesses; it has not explained why in some cases possible behaviour becomes actual behaviour, whereas in others it does not. In the case of the man who thus can do what he ought, but does not do so, we are still faced

with the question why Jones does not want to be a good man strongly enough actually to set himself on the way to becoming one. Clearly Plotinus' answer that he is misled by matter, by the body, etc., needs qualification, because we wonder why some people are misled more than others if their "upper souls" are in the same state.

Let us go back to our formulation of the problem in terms of what the good man will not do. For Plotinus no man is good except in so far as he has knowledge and acts in certain ways; and if he knows and acts in these ways, he cannot, by definition, act in a contrary sense. Plotinus' view therefore must be that if a man does not do what he ought to do if he is to be a good man, it can only be because he does not *understand* how beneficial it is to be a good man, and therefore has not chosen to be. In *Freedom and Reason* R. M. Hare put forward the suggestion that people bait bears because they lack the imagination to put themselves in the bear's place. But imagination is not the root of the problem.<sup>12</sup> Imagining what it is to be a bear is not being a bear, and a good imagination may only encourage the bear-baiter to persist. But to *understand* the impact of cruelty on the self – and to see that it is not beneficial – may be an adequate motive for leaving the bear in peace. Plotinus would not put an objection to Hare in quite this form, but I should like to argue that what he says about the nature of obligation to others and to the self is sufficient justification for developing his thought along lines of this sort. If this is co-operation with Plotinus, so be it; others would say that it is part of the critical history of philosophy.

#### NOTES

## Dynamic Structuralism in the Plotinian Theory of the Imaginary

by Evangelhos Moutsopoulos

*University of Athens*

In 1960, a contemporary French thinker, Gilbert Durand, published a thesis under the suggestive title "*The Anthropological Structures of the Imaginary: An Introduction to General Archetypology*." I wish to adopt Durand's terminology in order to speak of the *imaginary structures in human reality* in the philosophy of Plotinus.

A certain methodological reversal is possible, I believe, when speaking of the imaginary in the work of Plotinus. One may proceed to an inquiry on the meaning of the imaginary by starting not from imagination considered as a noetical function, but rather from the image, which is the structural reality of imagination in consciousness. In other terms, one may think of the image as the first datum, and not as a product of the imaginative activity.

By operating on such a reversal one may depart from the tradition of Aristotelian and Scholastic views on imagination by considering to what extent, according to Plotinus, it is not the imagination that offers images to the consciousness, but rather the images that fertilize the imaginative activity.

This reversal reveals a whole new perspective in the investigation of Plotinus' thought. However, it should not be considered a revolutionary one. It does not deny the dynamism of consciousness, but simply places emphasis upon the dynamism of the image.

In the fourth volume of his *History of the Psychology of the Greeks*, A. E. Chaignet<sup>1</sup> has perhaps foreseen this aspect of the problem. Although he failed to draw out the full implications of this approach, some of his interpretations show that he has been able to grasp the meaning of certain Plotinian texts, dealing with the problem of the imaginary.

I do not think that Chaignet has discovered any new meanings which were hidden up to his time. What he has done is to point out some extensions of interpretations which had already been accepted, and that he has extended them beyond their traditionally accepted meanings.

In examining two Plotinian texts concerning the relations between being and consciousness, on one hand, and memory and imagination, on the other, Chaignet does not hesitate to refer the activity of recollection, as well as the consciousness of structural forms of existence, to the dynamism of the image, independently from the way it is considered, i.e., either as figurative or not.

The first text is from the *Problems of the Soul*, part one, IV. 3.29: "memory and recollection are functions of the imaginary." The other text is from part two of the same treatise, IV. 4. 3: "the soul is and becomes whatever it recalls." By correlating the two texts we come to the conclusion that the soul changes on the ground of its imaginary activities.

P. V. Pistorius, in his book on *Plotinus and Neoplatonism*, has tried to show that, if the soul really changes (as it is stated in the second of the above texts), according to the object of its recollection, it is due to the fact that recollection carries the soul away from the intelligible world. I quote: "The essential function of the soul when it is freed from the body is intellection or contemplation. Such intellection is timeless. Because there is no past or future in the ideal world, there is no room for memory . . . it is not as if death simply terminated any memory of human life and a new memory era was born. Any memory is annulled, and because there is no time in the ideal world and everything is an eternal moment, there is no possibility of recalling things that happened there."<sup>2</sup> If the soul is capable of recollection, this is due to the fact that it still remains within the limits of time.

In commenting on the same text, Chaignet throws some light on a very different aspect of it. In effect, he states that "to imagine does not mean to possess, but to contemplate, and to become what one contemplates" (*op. cit.*, p. 198). It is not, then, consciousness that grasps an imaginary datum but, on the contrary, it is precisely such a datum that renders the consciousness capable of grasping it in its formal totality.

One should not, of course, attribute to the consciousness a passive structure making of it a completely malleable aspect of the soul. Such a type of consciousness would only have the possibility of formal impressions (IV.3.26), of the kind mentioned by the Stoic tradition which considers the soul as a *tabula rasa*. Against this rather sensualistic stoic empiricism, Plotinus makes clear that, in reality, such impressions take place within the soul, just as in thinking (IV.3.26).

One must take into consideration that the texts of Plotinus mentioned here also refer to the notion of recollection. However, for Plotinus the memory is finally reduced to the imagination (IV. 3. 29). Hence the dynamism of imagination can be established through the memory which is capable of grasping the particular objects of the soul, and through the general capacity of the soul to grasp itself in the reality of its existence; for, as Chaignet writes, "The proper states of the soul are the only objects grasped by imagination" (IV. 3. 29). This assertion is somehow exaggerated, since Plotinus does not deny the reality of the sensible objects, but only the equality of their degree of reality, in comparison with the intelligible objects. In any case, there is no need to make any rapprochement between Plotinus' views, as they are interpreted here, and, for instance, Bergson's own intuitionistic views. One has, however, to point out the similarity of the respective expressions.

Imagination is not confined to represent only sensible objects. Its activity also extends to the reinforcement of formal structures which help make conceivable some states proper to the essence, which are the means through which the soul is aware of itself, without any interference of reason.

Under such conditions, it is possible to say that the soul becomes whatever it represents to itself at an imaginary level, since in reality, what the soul is capable of representing to itself

is its own state. Imagination may then be considered as open to images that come from the world of the senses, and also from the depth of existence. Its role consists in structuring the formal data, i.e., the images, in order to enable them to impose themselves upon consciousness.

Yet, the soul does not become "whatever it recalls" in an absolute manner. For, being dependent at this level on the formal data of imagination (which, in turn, is oriented towards the sensible as well as towards the activity of existence) the soul never adopts attitudes which correspond in every respect to its inner reality.

Imagination displays impressive adaptability and dynamism. Imagination, Plotinus says, does not possess its object. However, as it possesses its vision, it makes itself available according to it; as he says at IV. 4. 3:

In this self-memory a distinction is to be made: the memory dealing with the Intellectual Realm upbears the Soul, not to fall; the memory of things here bears it downwards to this universe; the intermediate memory dealing with the heavenly sphere holds it there too; and, in all its memory, the thing it has in mind it is and grows to; for this bearing-in-mind must be either intuition (i.e. knowledge with identity) or representation by image: and the imaging in the case of the Soul is not a taking in of something (as of an impression) but is vision and condition—so much so, that in its very sense-sight, it is the lower in the degree in which it penetrates the object. Since its possession of the total of things is not primal but secondary, it does not become all things perfectly (in becoming identical with the All in the Intellectual); it is of the boundary order, situated between two regions, and has tendency to both.

In this way, the soul possesses various objects, but possesses them in a secondary way, for it does not entirely become all of them. The soul is something intermediate between the sensible and the intelligible; and, being such, it is oriented towards both of them (IV. 4. 3). It should be understood here that the intermediate character that Plotinus attributes to the soul is analogous to the intermediate character attributed to imagination.

Far from behaving passively, the entire soul is adapted to the image that imposes itself upon the imagination. The soul, then, becomes conscious of that image, since it is aware of itself having already adopted the form of the image in question. This conception will be widened by Proclus in whose work imagination will be considered as having even stronger structuring powers.<sup>3</sup>

Chaignet (*op. cit.*, p. 198) admits that, in this way, an image might be "empty of any real content", and thus become related to error. However, he takes care to add to the above expression the terms "real" and "immediate": "empty of any immediate real content." Thus, this expression completely changes the orientation of an eventual empirical interpretation of his text. The image may, indeed, not be a representation which is completely adequate to the object it represents or to the state of the soul of which it makes consciousness aware. This fact does not, however, render less real the image in question, at least to the extent to which this image impresses itself on the consciousness. Its reality is not an immediate and direct one in relation to the object or the state represented. Yet this same reality becomes immediate and direct in relation to its presence within the consciousness upon which it is imposed. Speaking of the image as well as of the imagination, Chaignet writes that both of them have a magic power that enables them to operate within the whole domain of understanding; and that one of the causes of this magic power resides in the reality of the presence of the image.

According to the above "dynamistic" considerations, Plotinus asserts at III. 7. 8 that the sensitive soul has, through an indefinite image, a sort of premonition of what the being is. Such an indefinite image is not deprived of any form or shape, but simply of the clearness of the data of perception.

Due to its dynamism, imagination permits the passage from one level of the consciousness to another of data corresponding to each one of these levels. It offers to the understanding the contents of the sensible world, as well as offering to the entire soul a certain aspect of its being, even if this aspect is a confused one.

One may understand this coexistence of confusedness and form through a curious and suggestive text of Proclus: "The infinite is left to exist alone in the imagination; for imagination does not conceive the infinite. Indeed, when conceiving something, imagination attributes to it a form and a limit . . . . But the infinite is not subject to any conception by the imagination which refers to it in an indefinite way . . . rather than conceives it. Imagination has a knowledge of the infinite by not conceiving it, just as the sight has a knowledge of the infinite by not conceiving it, just as the sight has a knowledge of the darkness by not seeing it."<sup>4</sup> The meanings of the expression "refers to it in an indefinite way" and of the term "infinite," remind us of the meanings of the above mentioned terms: "indefinite" and infinite image" in Plotinus. The meaning of this text of Proclus, which is really astonishing, may be completed by another text of the *Comment. in Crat.*, 76. 26 (Pasquali): "Imagination is a formative and impure thought."<sup>5</sup>

The only concession of the formative imagination to informative understanding is due to the presence of objects of consciousness deprived of any form, or possessing a form that we discern with difficulty.

The image is the means through which the soul represents to itself whatever exists beyond the senses and beyond understanding. Being more than a simple form, the image exercises its power upon the understanding, of which it shapes, so to speak, the contours in such a way as to subjugate them to the exigencies of existence. In the framework of consciousness, the perceptible image and the intelligible being (called particular concept) coexist within the image. It is in this way that one should understand the role of articulated language in fixing the meaning of concepts. As Th. Whittaker states, "Thought is apprehended by imagination as in a mirror (I.4.10), the notion (*nōema*) at first indivisible and implicit being conveyed to it by an explicit discourse (*logos*)."<sup>6</sup> Only when duplicated through reflection may consciousness grasp itself.

Images of noetic nature are, of course, also present in consciousness. They not only determine, but also fertilize its activity (IV. 4. 11). An image is not only able of representing,

but also of provoking a psychical fact with reference to some sensible object. However, it is a psychical fact itself. It is not only a reflection of some higher truth, but also a reality, an activity. It is motion in itself as well as motion of the soul towards what is represented by the image.

The degree of reality of the image does not depend only upon the degree of its similarity to some real model of which it may be an imitation (I. 2. 2; I. 2. 7; VI. 2. 8), but also upon the fact that the image makes consciousness capable of grasping the intelligence, and of representing it to itself, in order to direct itself towards it (in a movement that reminds us of the movement through which the soul is directed towards the Good: V. 6. 5). The image thus becomes the principle as well as the means of the participation of the soul in intelligible realities, although it is not necessarily one of them (III. 6. 14).

The irrational character of the image does not prevent it from having a proper structure, a structure which is due to its coming from inner existence. Furthermore, the image impresses that particular structure of itself on consciousness. However, this very irrational character of the image is illustrated by the fact that the image itself is imposed upon the thought without waiting for the judgment of reason (I. 1. 9). Thought is therefore, for Plotinus, an element of false reasoning and it even leads to false considerations, in spite of the fact that in reality thought and imagination are essentially different from each other (I. 4. 10). However, both thought and imagination are subject to error since the image is connected to opinion, which is thought without reasoning. But rectitude is not necessarily the only truth, and the truth of the image is its reality which is directly related to the reality of existence.

Besides, the image is a reality of the soul, and as such it is opposed to reason conceived as a rational principle, since the image itself is related to the irrational (but not to any unreality) of the soul. Plotinus makes clear the fact that the image is a "stroke of something irrational coming from outside" (I. 8. 15).<sup>7</sup>

It seems that these various expressions referring to a certain shock are due to a common source. However, although Plotinus admits that the image is "a stroke of something

irrational coming from outside," he refuses to comment on the nature of this shock which we would then suppose to be something like an impression. But, in that case, the image would not differ from any sensation. The term "*exothēn*" (from outside) seems, of course, to suggest such an interpretation and it would be possible to think that the passage in question refers only to images of external provenance, due to sensational operations.

In other words, Plotinus could have given to the various terms denoting the image (*eikon*, *phantasma*, *eidolon*), a more restricted meaning compared to that given to them in other Plotinian texts. Such a fluctuation, however, of which many parallel cases are to be found in Plotinus should not surprise us; for, as Emile Bréhier states in the *Introduction* to his edition of the *Enneades*: "by virtue of the law of the 'genre' he has chosen, Plotinus ignores the art of systematically developing a doctrine".<sup>8</sup> In any case, one should admit that in numerous passages (as in I. 1. 4; III. 7. 8; IV. 3. 30) Plotinus seems to consider the notion of image as denoting something more than a simple sensible impression.

The second part of the sentence, where it is said that the soul "receives the stroke through its compound nature" (I. 8. 15), raises the problem of the relationship between the parts of the soul and the receptivity of the soul concerning external impressions. But, as E. Barbotin remarks in the *Introduction* to his edition of Octave Hamelin's text, in French, on "*The Theory of Intellect according to Aristotle and his Commentators*",<sup>9</sup> the term "*exothēn*" (from outside) seems to have a certain technical significance but without any precise meaning, so that it is not necessary that in this case this same term be taken as denoting any intrusion of the external world into consciousness through the image.

Thus, the image, itself, remains irrational, because it is independent from any control of the reason, and it is present at all the levels of human activity, except the purely physical and physiological one (III. 6. 4). Plotinus even indirectly supposes that the image is radically different from sensation, since he distinguishes two respective functions of the soul to which each of these two kinds of data refer to: the sensitive function and

the imaginative function. He even suggests that (at least at a certain level) the activity of the soul is reduced only to these two functions (IV. 3. 23). Plotinus then goes on to state what he has already suggested, i.e., that the irrational character of the image impresses its seal upon the thought, independently of reason, to the judgment of which it is not submitted (I. 4. 10). He now asserts that sensation as well as imagination are subordinated to reason which, through its lower aspects, is akin to the higher aspects of these two functions of the soul (IV. 4. 3).

In the same context, Plotinus thinks that sensation and imagination should also concern the body, namely the part which is most able to receive their activity. Through them, reason, which is completely independent of the body, is indirectly connected to it. What seems to be important in this way of considering the facts is that the various functions of the soul, seen from the viewpoint of the image, seem no longer to be mechanisms consisting of distinct parts. The activity of the soul, therefore, seems to be an organic whole whose particular functions are so closely related that they are confused, in a way, with each other (IV. 4. 1).

The image thus becomes an organized representative structure formed out of initial data which it validates by referring them to the activity of reason (IV. 3. 23). Through a temporary submission of the imagination to reason, the image, which is a form that activates imagination, seems to impose itself in return upon the dynamism of existence in general, from which it comes.

However, no dynamism of the imagination leads to awareness independently of the presence of the image considered as being the image of an object. Such an "objectified image" is all but irrational. Thus, unless one accepts, together with Chaignet,<sup>10</sup> through an excessively analytic and "scholastic" procedure, the fact that the distinctions made between the various forms of imagination may be preserved, and even applied at the level of the image itself (I. 4. 10 and III. 6. 10), it will be necessary to accept the fact that the image is a structure which is originally present at all the levels of the activity of

consciousness, and that only later is it submitted to the influence of reason.

The process that such a conception of the image presupposes, in this case, is not at all clear. For the image is considered first as the main vehicle of the tendencies of the inferior soul, and then as imposing on these tendencies a regulative order whose principle must be sought within the region of the logos. Be it as it may, it seems that in Plotinus, this whole theory is based upon the intention that various effects be referred to a unique principle.

This is not incompatible with the synthetic spirit of the philosophy of Plotinus, in spite of certain exceptions which one may easily point out. One has to deal here with the agreement of two different and even opposed facts.<sup>11</sup>

The image has a part to play, according to Plotinus, not only at the level of *theoria*, but also at the level of *praxis*, in other words, at the level of human ethical behavior. Referring to the causes of such a behavior, Plotinus, according to E. Bréhier, makes an allusion to the efforts of Chrysippus to reconcile destiny (conceived as a connection of causes) with liberty.<sup>12</sup> Within such a general theoretical framework, Plotinus asserts that the provenance of the causes of human behavior is to be found in a principle which is unique; and that they only enable us to proceed towards the direction in which they are pushing us. Representations will then be the effects of former causes, and the tendencies will be in accordance to these representations (III, 1. 7). This is not, however, always the case, for it is possible that images may be opposed to the tendencies of the body, which means that one frequently has to deal with conflicts of images (V, 10. 26).

Representative images are related to irrational manifestations of the soul, and they translate the activity of such manifestations through forms which admit of a certain structural revision. The image thus becomes an epistemological and, at the same time, an existential principle that connects the irrational to the logos. This seems to be due to the fact that, on the one hand, the image is, potentially, a formal structure of behavior as well as a structured form; and that, on the other

hand, it is capable of extending its possibilities to the whole existence.

It is possible to admit that, in this context, the connection of the constitutive aspects of man takes place at the level of the image. One may conceive of an ascending and of a descending dialectic of the imaginary in Plotinus, in spite of the fact that their respective articulations are not clearly distinguished. It should only be asserted that, independently of its unconscious antecedents, the image remains a first datum in relation to the imagination considered as a concrete aspect of the consciousness, and that, through the image, the rational consciousness manifests itself as oral speech and as a model of behavior.

In any case, the force of images is equalled by the correspondence of consciousness to them. Being forms either of sensible or of any other provenance, images provoke the apparition of other forms which have previously existed as potential forms in the consciousness. This is why the image and the imagination are not considered separately from each other, but only with reference to the functional relation existing between them. One does not have to consider the imaginative activity, but only the world of the imaginary itself. In effect, the active character of the imaginary seems to be located in the way the dynamism of consciousness is confirmed during its contact with the image.

What is fluid and uncertain does not become an object of consciousness unless it takes a form, provided the form does not have a static character. But as soon as the discursive reason tries to determine this form (and, through it, the object itself by identifying and by consolidating it), the formative image which emerged from former fluidity of the object now vanishes and is replaced by an abstraction.

This does not mean, of course, that the image is reality itself. Plotinus considers the image as a shadow of reality. What renders the image real, at least to a certain extent, is its aptitude to substitute the objective reality by introducing itself into consciousness, and by imposing itself upon it.

This structural aspect of the status of the image and of imagination in relation to the activity of consciousness is such that one may observe in Plotinus the first outline of a dynamic

structuralistic consideration of imagination and of the imaginary which is the direct consequence of the reversion of the classical Aristotelian conception of imagination as being a noetical function. By conceiving the image as a first datum, Plotinus becomes the distant forerunner of contemporary psychological structuralism.

## Image, Symbol and Analogy: Three Basic Concepts of Neoplatonic Allegorical Exegesis

by John Dillon

*University of California*

### I

The contemporary relevance of this subject is, perhaps, not great. Allegory, as such, is rather out of fashion. But for much of European history allegory has been indulged in freely, in all forms of art, and any discussion of the rules of allegory in any age or culture should be of general interest. Even today, the search for Freudian motifs and Jungian archetypes must have its rules – that is to say, ways of judging when a false analogy has been made.

This paper is simply an attempt to sort out, through an examination of some individual contexts, the possible difference of meaning between two basic terms of Neoplatonic allegory, *eikon* and *symbolon*, and in this connexion the use of the term *analogia*/*analogon*. In such company as this, I do not come so much to instruct as in the hope of learning more. There are, after all, many nooks and crannies of Neoplatonism into which I have not yet penetrated. What chiefly concerns me is the question of the *rules* of Neoplatonic allegory. By what system does one recognise in a given text an image or symbol of metaphysical reality? How can one learn to recognise the correct '*analogia*'? I do not find these rules stated anywhere in the writings of the Neoplatonist commentators. That is not to say that they are not there, however, and I would be glad to have pointed out to me some passage which I have overlooked.

It is possible, on the other hand, that the rules of Allegory cannot be stated precisely, but must simply be derived from experience – sitting at the feet of one's master – and from personal inspiration. I myself, after all, feel that I can now recognise a symbol in a given text and observe the correct analogy, but I would be somewhat at a loss to say on what precise principles I was proceeding, except the simple discernment of points of similarity. This may well seem to be an intolerably vague conclusion, and I would be glad to have the whole question made more definite.

## II

That said, let us turn to a few texts. Near the beginning of his *Commentary on the Timaeus*, in connexion with the exegesis of the lemma *Tim.* 17BC (where Socrates declares his intention of giving a recapitulation of his discourse of the previous day on the Ideal State). Proclus makes the following comment (*In Tim.* I 29, 31 ff. Diehl):

"Some (sc. Porphyry), taking the recapitulation of the *Republic* in an ethical sense (*ἠθικώτερον*), say that it reveals to us that we must enter upon the contemplation of the Universe in an ethically ordered frame of mind; others (sc. Iamblichus) consider that it has been placed before the whole enquiry into Nature (*φυσιολογία*) as an image (*εἰκὼν*) of the organisation of the Universe; for the Pythagoreans had the habit of placing before their scientific instruction the revelation of the subjects under enquiry through similitudes (*ὅμοια*) and images (*εἰκόνες*), and after this of introducing the secret revelation of the same subjects through symbols (*σύμβολα*), and then in this way, after the reactivation of the soul's ability to comprehend the intelligible realm and the purging of its vision, to bring on the complete knowledge of the subjects laid down for investigation. And here too the relating in summary of the *Republic* before the enquiry into Nature prepares us to understand the orderly creation of the Universe *through the medium of an image* (*εἰκονικῶς*), while the story of the Atlantids *acts as a symbol* (*συμβολικῶς*); for indeed myths in general tend to reveal

the principles of reality (*τὰ πράγματα*) through symbols. So the discussion of Nature in fact runs through the whole dialogue, but appears in different forms according to the different methods of revelation."

This, I think, is a good passage from which to start, as it sets out – or seems to set out – a clear distinction between an *eikon* and a *symbolon*, and, further, links the whole theory of allegory firmly with Pythagoreanism. I believe Iamblichus to be responsible for introducing this theory in its developed form into Neoplatonism, and he will have derived it from his Neopythagorean sources of inspiration, Numenius, Nicomachus of Gerasa, or even Apollonius of Tyana. I am not, however, concerned here with the origins of the theory, but rather with the nature of it.

We see, then, a three-level system of exegesis set out. The Pythagoreans, it seems, before revealing directly the truths of their doctrine, would take the disciple through two preliminary stages. First, they would present to him *homoia* and *eikones* of reality. Obviously these were not their famous 'symbols' (of which Iamblichus gives an extended account at the end of his *Protrepticus*); the very word used for them precludes that. An *eikon* must be something simpler and more straight-forward. The only clue we have from this passage is that, in relation to the doctrine presented in the *Timaeus*, the recapitulation of the *Republic* is an *eikon*, while the Atlantis Myth is a *symbolon* (it is also suggested here that *all* myths are *symbola*). But it is just here that the difficulties begin. It is not clear, to me at any rate, nor is it made clear by Proclus, how the recapitulation of the *Republic*, or the description of the Ideal State in general, differs generically, as a representation of cosmic truths, from the Atlantis myth, or from myths in general. Indeed, a little earlier in the work (p. 4, 7ff.), Proclus speaks of both the recapitulation of the *Republic* and the Atlantis myth as representing the order of the universe *δι' εἰκόνων*, the *Republic* being an *eikon* of its unity (*ἑνῶσις*), the Atlantis myth of its division (*διαίρεσις*) and of the opposition of the two basic orders (*συστοιχίαι*) within it – or, alternatively, the *Republic* can be seen as being like to (*ὁμοιωσθαι*) the heavenly realm, the Atlantis myth to the realm of *genesis* below the Moon. Not only are both here *eikones*, but they may be seen as images of rather

different things, in one case of unity and diversity extending all through the Universe (a vertical distinction, one might say), or, alternatively, or the superlunary and sublunary realms (a horizontal distinction).

Let us for the moment confine ourselves to *eikones*, and consider in what respect they might reflect reality. For an *eikon*, in fact, 'reflecting' should be the key word. An *eikon* is, after all, properly a mirror-image, or a direct representation, of an original, its *paradeigma*, whereas a *symbolon* merely 'fits together' with some corresponding reality in a higher realm. One might use the comparison of a statue of Winston Churchill, say, on the one hand, with Churchill's cigar – or perhaps, a picture of Cinderella with Cinderella's slipper. The statue and the picture are plainly *eikones*, the cigar and the slipper *symbola* – particularly the slipper. These examples are certainly crude, but perhaps they will do as preliminaries.

If we return for the moment to the statue of Churchill, we can immediately see the difficulties. The statue, if it is a good one, will have a one-to-one correspondence with the various (external) features of its model. But at least the model, the *paradeigma*, is a physical object; we can compare image and archetype with the same faculty. If one takes the most obvious Platonic example, the comparison of the Sun as *eikon* with the Good as *paradeigma*, we have arrived at the point of difficulty. Why is the Sun an *eikon* (*Rep.* 509a9), and not a *symbolon*? Following Plato, we maintain that there is a one-to-one correspondence between Sun and Good. Both are a source of visibility, and even of existence, to the entities subordinate to them, the world of sensible objects and the world of intelligible objects. In the case of the Ideal State of the *Republic*, the three classes therein described must correspond exactly to the triple division of Gods, Daemons and Men in the Universe, and their mutual relations and activities must also correspond. But then, we say, the battle of the Athenians with the Atlantids seems to correspond well enough to the constant struggle in the Universe between the forces of order and disorder, unity and diversity, represented at the highest level by the archetypal opposition of Monad and Indefinite Dyad. What, if anything, makes the one an *eikon* and the other a *symbolon*?

### III

For further elucidation of this, I would like to turn from Proclus' *Timaeus Commentary* to his *Commentary on the Republic*, and specifically to the essay in which he discusses the theory behind Homer's mythologising (*In Remp.* I pp. 71-96 Kroll). Here Proclus is seeking both to defend Homer from the charges made against him in the *Republic* and to defend Plato against the charge of inconsistency in his attitude to Homer. This essay makes an important distinction between *eikon* and *symbolon*,<sup>2</sup> and it is a rather unexpected one. How, asks Proclus (72, 9ff), can such stories about the Gods as Homer, Hesiod and even Orpheus tell – rapes, thefts, bindings, castrations and so on – bear any relation at all to divine realities? Must not stories that are to represent (*ἀπεικάζεσθαι*) things divine imitate the order and unspeakable transcendence of these entities? Here, I think, we have a clue. An Homeric tale, such as, say, the story of Ares and Aphrodite, does not precisely mirror the intellectual calm and unanimity in which the Gods must live. If it in fact resembles that reality in any way, it must do it indirectly. In the course of presenting the common criticism of Homeric myth, Proclus says the following (73, 11ff):

"... for these *symbola* have obviously no resemblance (*οὐ ... ὁμοκότα*) to the essential natures of the Gods. But myths must surely, if they are not to fall short utterly of representing the truth, have *some* resemblance to the nature of things (*ἀπεικάζεσθαι πῶς τοῖς πράγμασιν*), the contemplation of which they are attempting to conceal by means of the screens of appearance (*τοῖς φαινομένοις παραπετάσμασιν*)."

On the other hand, he continues, Plato in many places instructs us mystically about divine matters through *eikones*, bringing in nothing shameful or disorderly or materialistic into his myths, but, while concealing his transcendent intuitions about the Gods, yet presenting by way of concealment visible images (*ἀγάλματα*) which accurately represent the realities of the secret theory hidden within them.

Now what is the distinction being made here? Surely it is simply that Plato's myths, and indeed the purified myths which

Socrates would propose for the poets, have in them no feature that is *prima facie* discordant with our conception of divine nature. That is to say, they bear on their face the signs of being representations of *some* divine reality – though without authorised exegesis the layman cannot say precisely what. A poetic myth, on the other hand, with its rapes and conflicts, does not mirror the divine nature in this direct way. Nevertheless, it does represent truths about the universe in an indirect way, as Proclus explains further on (81, 28ff). The binding of Kronos, for instance, represents the uniting (ἔνωσις) of the whole creation to the intellectual and paternal transcendence (ὕπεροχὴ) of Kronos (82, 14ff). These myths, we learn at 83, 9, are *symbola*. The Gods, Proclus asserts, actually enjoy hearing these stories about themselves; that is why such tales are a feature of mystical rites and ceremonies (83, 18ff).

#### IV

But let us halt at this example of the binding of Kronos. Why, one asks, is this a *symbolon* and not an *eikon*? As far as I can see, the actual distinction centres round the subject matter. It is not so much a question, I think, of whether or not the story is discreditable or obscene on the surface – though the myths in question normally are – as whether or not the story seems to have a self-contained meaning, not directly pointing to any truth beyond itself, in the way that a conscious allegory should. A Platonic myth, or some purified (and thus allegorised) poetic myth, we would have to maintain, is plainly representative of something else, even as a statue is plainly a statue of someone or something, whereas an unreformed poetic myth appears just to be a good story in its own right, as for instance the Tale of Ares and Aphrodite.

This distinction may or may not seem cogent to us, but it is at least, I think recognisable. The issue of immorality in the non-iconic myths seems to me to be secondary, although in fact both Plato and Proclus dwell on it a good deal, and of course this 'scandal' of immoral stories had been used ever since the beginnings of allegory as a compelling reason why these stories *must* be allegorised. If we return to our original text in the *Timaeus* Commentary, we may now say that the Atlantis Myth,

if it is a *symbolon* and not an *eikon*, must be taken as being a story which does not directly point to any meaning beyond itself—it is a tale of a great war of long ago, and can be regarded as simply history—whereas the recapitulation of the *Republic* has an obvious allegorical signification. We *should* also be able to add that the Atlantis story portrays divine truths in a *prima facie* discordant way. This would imply that the elements of the universe do not fight each other in the same way as the Athenians fought the Atlantids. The problem here is that in fact the elements—or rather the conflicting forces of Form and Matter—are fighting each other in very much this way. Why is the portrayal of their mutual relations in the *Republic* iconic, while this is symbolic?

#### V

But I do not wish to raise difficulties at this stage. If we are to try and confirm the distinction, the *symbolon*, in the Pythagorean system, must be seen as a higher stage of allegory than the *eikon*, first of all, perhaps, because it is more difficult to discern as being allegorical at all, but secondly, I assume, because it tends to represent more ineffable truths, truths which are not susceptible of full representation through *eikones*.

If Proclus himself observed these distinctions in an entirely consistent manner, our task would be much easier, but he does not. In an attempt to shed some further light on the question, I would like to turn now to the consideration of the allegorisation of the characters in the two dialogues *Timaeus* and *Parmenides*, together with the allegorisation of the whole introductory situation in the *Parmenides*, to see if any consistent pattern emerges.

First let us ask ourselves whether we expect the characters (πρόσωπα) of the dialogues to be *eikones* or *symbola*? In the sense that they do not *prima facie* suggest – to the normal reader – that they are representations of any 'higher' truth, one might take them to be *symbola*; on the other hand, they themselves, and their mutual relationships, might be thought to mirror Reality in the same way that the various classes in the Ideal State of the *Republic* do, and thus qualify as *eikones*. We

must now see how the case actually stands. When the identifications of the characters are first made in the *Timaeus* Commentary (I 9, 13ff), the arrangement of the characters – that is, a trio of auditors listening to a single speaker – is described as an *eikon* of the organisation of the Universe:

“The father of the discourse should correspond (ἀνάλογον ἔσταναι) to the father of Creation (for the creation of the cosmos in discourse is an *eikon* of the creation of the cosmos by the (demiurgic) intellect); while to the demiurgic triad which receives the unitary and generic creation of the Father, there should correspond the triad of those who receive the discourse, of whom the summit is Socrates, joining himself directly to Timaeus by reason of contiguity of life-force, even as in the paradeigmatic realm the first principle is united to that which is prior to the triad.”

On the other hand, when the matter is taken up again later (I 198, 25ff, *ad Tim.* 27AB), the arrangement of speeches among the characters is described as a *symbolon* of the creation of the Universe, and the passage ends (200, 2-3) with the sentence: “These things then one may understand in some such symbolic sense as this (οὐτως αἰ συμβόλων), without, perhaps, reading too much into them.”

The sad fact is that, if one checks assiduously through Diehl's index under *eikon* and *symbolon* right through Book I of the commentary one will find the two terms used indiscriminately for characters, events, and even words and phrases. In one passage at least (94, 27f) we find both delightfully combined. The causal principles of creation are said to be represented in the Atlantis Myth ‘in images through symbols’ (ἐν εἰκόσι διὰ τινων συμβόλων). Plainly it is only when he is on his very best behaviour that Proclus maintains any strict distinction between the two terms.

In the *Parmenides* Commentary the situation is much the same. At 660, 26ff *Cousin*, the allegorical significance of the places of origin of the various characters is set out:

“Ionia is a *symbolon* of Nature, Italy of intelligible being; Athens is symbolic of the median position between these, through which an ascent can be made from the realm of

Nature to that of Intellect for souls who are stimulated to such an ascent.”

However, after a good deal more of such identifications, during which neither of our key terms is in fact used, we have the phrase ‘presents an *eikon* (εἰκόνα φέρει)’, employed in two successive sentences of summing up: “The above-mentioned presents an *eikon* of these realities to those not entirely incapable of observing such things.” (661, 21), and, a little further down (662, 10), “All these (situations and characters) present an *eikon* of the Gods themselves, and would provide no problems to those who are willing to follow out the *analogia*.”

## VI

The third basic term in our investigation has now presented itself forcefully, and we may profitably turn to an examination of it, especially as the allegorisation of the characters in the *Parmenides* Commentary makes use of it more than of either of the other terms. *Analogia* in Neoplatonic terminology always retains something of its mathematical sense of ‘geometrical proportion’, and is frequently so used in the course of Proclus' commentaries, but in the context of allegorical exegesis proper it signifies the correspondence between the surface meaning of the text (or of the characters, things and actions mentioned in the text) and the metaphysical truths of which it, or they, are the expression. This must have been seen as a sort of fixed mathematical relation, but it is not the sort of relation that could be stated in any kind of formula.

We may at this point suitably reintroduce the Pythagoreans. They are reported by Proclus (*In Tim.* I 33, 4ff), again in connexion with the recapitulation of the *Republic* (*ad Tim.* 17c), as follows:

“The account of the Ideal State and the condensed and succinct summary of the classes within it contributed to the general presentation of these descriptions, taken as *eikones*, to (the appreciation of) general truths. And indeed this is precisely how the Pythagoreans used to go about things, tracking down the points of similarity (ὁμοιότητες) in the world on the basis of *analogiai*, and passing from *eikones* to their respective *paradeigmata*.”

The Pythagoreans, then, as we might expect of such mathematically-minded folk, employed *analogiai* to discern what the surface phenomena they dealt with were *eikones* (and presumably *symbola*) of. Once again, however, there is no clue as to what precise rules are to be followed in fixing the *analogiai*, and I would suggest that there were in fact none that could be formulated. That is not to say that the resulting allegory is arbitrary, as Fr. Amandus Bielmeier would suggest ("Die *Wilktir hat hier im einzelnen freies Feld*", op. cit. p. 76); it is surely plain that it does in fact follow a fairly strict system. All I would suggest is that the discerning of the correct 'analogies' had to be learned by experience.

That there was a distinct sense of correctness and incorrectness in this area is made plain by a number of passages. At *In Tim.* I 165, 16ff, for instance, Porphyry is reported as being criticised by Iamblichus, *à propos Tim.* 24D, for situating Athena, as described in the passage, in the Moon. Iamblichus' criticism is that Athena must be ranked higher than the Moon, which is simply one of her emanations. Porphyry 'has not correctly preserved the *analogia* (οὐ καλῶς τὴν ἀναλογίαν διασώζεσθαι). In the context this seems to mean something like: 'the correct *analogia* is 1:100; Porphyry has made it 1:10'. At another point, Proclus himself, once again *à propos* the recapitulation of the *Republic*, makes a remarkable statement. It is possible, it seems, to have various correct *analogiai* to a given surface phenomenon (*In Tim.* I 57, 22ff):

"And if we formerly took the *πόλις* (of the *Republic*) here below as representing the realm of generation, and now take it as representing the cosmic conflict, that should be no cause for astonishment. For it is safe to understand the same thing according to various *analogiai* in relation to different contexts."

— since, that is, the same thing by virtue of different aspects of itself can show an *analogia* to different elements of reality. It is possible, then, to postulate a multiplicity of correct 'analogies', as well, of course, as a multiplicity of wrong ones.

When we turn to the allegorisation of the *personae* of the *Parmenides* (*In Parm.* 628. 1ff), we find in fact that the terms *analogon* and *analogia* are those chiefly used (628, 2, 21, 31,

40), though *eikon* is used once (in the phrase *εἰκόνα φέρει*). Parmenides is to be taken as *analogon* to the unparticipated and divine *Nous*, the summit of the noetic world; Zeno is analogous to that *nous* which is participated by the divine Soul, and Socrates represents (here *ἔοικε* is used, which may be taken as a verbal form of *εἰκῶν*) the individual *nous*, capable of receiving the divine forms. Parallel with this scheme, however, Proclus declares that these three figures seem to him to 'preserve' (*διασώξω*) another *analogia*, according to which they represent respectively the three moments Being, Life and Mind within the hypostasis of *Nous*. Either of these *analogiai* are acceptable, it seems. They both represent great metaphysical truths.

*Analogia* then, is the principle on which allegorical exegesis is based, but when one has said that one has still not fathomed the principles on which it is applied. If one had the rules according to which one preserved the *analogia*, one would have the rules of allegorical exegesis set out before one. As I say, I do not see these rules stated anywhere in the Neoplatonic corpus, and I do not believe that they can be stated, even though they can plainly be learned. In the *Anonymous Prolegomena to Platonic Philosophy*, ch. IX, we find an elaborate set of ten rules for recognising the subject, or *skopos*, of a dialogue; if there had been set rules for allegorising, it would be in such a work as this that one would expect them to be set out.

## VII

This survey has not been particularly comprehensive, I fear, but I hope that it is at least representative enough to give a fair picture of the complexities of the situation. It seems to me to be the case that we have, on the one hand, evidence of a three-tiered system of Neopythagorean allegorical interpretation, perhaps first connected with the exegesis of Plato's dialogues by Iamblichus, which Proclus reports but does not himself follow very strictly — and which, indeed, could not be followed very strictly in the exegesis of a Platonic dialogue — and on the other hand, more normal Greek usage, in which the terms *eikon* and *symbolon*, together with *analogia*, could be used interchangeably with each other and in combination with a

good many other terms (e.g. ἐκφαίνεω, μπεῖσθαι, ἀπεικάζειν) to express the relation between the surface meaning of the text and the truths it allegedly represented. I am concerned with trying to distinguish the essence of the Pythagorean system from the looser usage that obscures it.

It seems fairly plain that some authority on Pythagoreanism did describe the school as educating its neophytes first through images, then through symbols, and then by the direct revelation of (mystical) truth. The symbols are plainly the well-known Pythagorean Symbols, of which, as I have mentioned already, we have a comprehensive survey at the end of Iamblichus' *Protrepticus* (ch. XXI). What might the *eikones* have been? Iamblichus' *Vita Pythagorica* might reasonably be expected to throw some light on this question, especially if, as I have suggested, he is the source of the application of this theory to Platonic exegesis, but in fact this work proves disappointing. There is indeed a good exposition of the Pythagorean theory of *symbola* in cc. 103-105, in which it is explained how the Pythagoreans veiled the truths of their doctrine with the deceptive appearance of the apparently foolish *symbola*, but there is no mention of *eikones* in this connexion, nor any suggestion of a three-tiered system, as opposed to a simple contrast of symbolic and direct instruction. Elsewhere, however, in cc. 64-67, there is a discussion of the use of music in philosophic training, in the course of which music is twice (in c. 66) spoken of as an *eikon* of reality, in this case of the harmony of the universe. This may give us some idea as to what might have been regarded as an *eikon* in a three-tiered system of Pythagorean instruction, but the fact remains that there is no explicit statement of such a system in the *Vita Pythagorica*. The exact provenance of the system, as well as its proper contents, remain, as far as I am concerned, something of a mystery, on which I would welcome enlightenment from this gathering. As regards the application of it to the allegorical exegesis of the Platonic dialogues, this is all that I can find to say at present.

## APPENDIX

## C. S. Peirce on Icon and Symbol

While not wishing to embark on a full historical survey of the meanings of these terms in Western Literature and philosophy, I think it not unsuitable to make a brief reference to one modern authority who makes notable use of the terms 'icon' and 'symbol', the American philosopher C. S. Peirce.

In an essay entitled *Logic as Semiotic: The Theory of Signs*,<sup>3</sup> Peirce produces an elaborate set of technical terms for the various possible types of sign. The only aspect of this with which I will concern myself is his definition of Icon, Index and Symbol (I include Index because it is linked closely by him with the other two, and shares in the distribution of characteristics which I find relevant to the understanding of the Neoplatonic distinction):

"A sign either an *icon*, an *index*, or a *symbol*. An *icon* is a sign which would possess the character which renders it significant, even though its object had no existence; such as a lead-pencil streak as representing a geometrical line. An *index* is a sign which would, at once, lose the character which makes it a sign if its object were removed, but would not lose that character if there were no interpretant. Such, for instance, is a piece of mould with a bullet-hole in it as sign of a shot; for without the shot there would have been no hole; but there is a hole there, whether anybody has the sense to attribute it to a shot or not. A *symbol* is a sign which would lose the character which renders it a sign if there were no interpretant. Such is any utterance of speech which signifies what it does only by virtue of its being understood to have that signification." (*op. cit.* p. 104)

Before entering upon a discussion of these definitions, I will append some further basic definitions, for those (like myself) who may be unfamiliar with Peirce's terminology:

"A sign, or *representamen*, is something which stands to somebody for something in some respect or capacity. It addresses somebody, that is, creates in the mind of that

person an equivalent sign, or perhaps a more developed sign. That sign which it creates I call the *interpretant* of the first sign. The sign stands for something, its *object*." (p. 99).

First, let me reformulate what I take to be the Neoplatonic, or Neopythagorean, definitions of *εικῶν* and *σύμβολον* in terms analogous to those of Peirce. It seems to me that an *εικῶν* in the three-tiered Pythagorean system is a sign which would lose the character that makes it a sign if its object were removed, or if there were no interpretant. It seems to me, in fact, that, rather than answering to Peirce's *icon*, it combines the characteristics of his *index* and *symbol*. An *eikon* clearly points outside itself to some other thing – in Neoplatonic metaphysics, to some noetic reality. Churchill's portrait loses its specific character if *either* there is no such person as Churchill or if no one any longer recognises Churchill. It is still a painting, but it is not, properly, a portrait of anyone. If we take the Pythagorean use of music as an example, a certain sequence of notes is only a soothing or mind-clearing sound if (as they thought) it accords with the harmony of the spheres and/or there is a mind such as to be soothed or cleared by it. Whether or not the examples from the Platonic dialogues that we have examined fit it uncomfortably, if at all. But perhaps Iamblichus (rather than Proclus) may have seen the ordering of the characters in the *Timaeus*, for instance, as having no significance at all apart from the metaphysical realities they are representing, whereas the Atlantis Myth has a clear and self-contained (historical) meaning, apart from its allegorical use.

What Peirce would call an *icon*, on the other hand, I would want to call a *σύμβολον*, that is, a sign which would possess the character which renders it significant, even though its object had no existence. A cigar, for instance, which could in certain circumstances stand as a symbol of Churchill, is still a cigar, even if there were no such person as Churchill. I am somewhat bothered by the distinction that Peirce makes here between an icon and an index. The mark of the pencil on the paper is a pencil mark even if there were no such thing as a geometrical straight line. It does, however, imply the previous presence of a pencil. The bullet-hole (*qua* bullet-hole) implies the previous

passage of a bullet. If, however, there appears someone (a child, say) who does not understand about bullets, the hole is for him just a hole. But for a person who does not understand about pencils, there is still a mark on the paper.

I do not want to get into an argument with Peirce, however his purposes in definition are somewhat different from mine. What I find useful is his basic distinction between a sign which has no basic meaning apart from its object or interpretant, and one which has. A Pythagorean symbol, it seems to me, has an independent meaning, such a meaning as would conceal from the ordinary public that it is a sign at all. Exhortations to make one's bed when one gets up in the morning, or to avoid main roads, seem perfectly straightforward. Even pieces of advice which might seem eccentric, such as not to let swallows into the house, or not to stir the fire with a fork, do not point in any particular direction to a meaning beyond their surface one. They have a more devious, or more hidden, relation to reality than does an *eikon*, and are thus properly introduced to the neophyte at a later stage.

In conclusion, I must confess to being by no means convinced myself that there is, normally, any clear distinction between *εικῶν* and *σύμβολον* in Proclus' system of allegory, but I hope that this investigation, together with the brief survey of Peirce's terminology, has made some contribution to the elucidation of the problem of those passages where such a distinction *is* being made.

## NOTES

1. The only secondary sources which I have been unable to uncover that are of immediate relevance to the subject under discussion (and even these are of limited usefulness) are: A. Bielmeier, *Die Neuplatonische Phaidrosinterpretation*, Paderborn 1930; and A. R. Sodano, 'Porfirio Commentatore di Platone', in *Entretiens Hardt XII, Porphyre*, 1965. Works on allegory in general have not proved helpful in this particular enquiry.

2. There is an interesting discussion of myths in chapters III and IV of Sallustius *On the God and the World*, as Professor John Whittaker reminds me. but, although Sallustius makes a division of myths into various types, theological, physical, ethical and so on, he nowhere makes a distinction between eikon and symbolon.
3. Printed in *Philosophical Writings of Peirce*, sel. and ed. J. Buchler. Dover Publications, 1944.  
Since writing this paper, I have come across an article by R. A. Marcus 'St. Augustine on Signs' (*Phronesis* 2:1, 1957), which contains much of interest on general questions of terminology, and which also, in an appendix (pp. 82-3), makes use of Peirce.

## PART THREE

### The Influence of Neoplatonism

## Marius Victorinus Afer, Porphyry, and the History of Philosophy

by Mary T. Clark

*Manhattanville College*

For a long time and until quite recently Victorinus (4th century African Rhetor who wrote in Latin) was judged to be in the direct line of the descent of Neoplatonism from Plotinus to Augustine. This opinion prevailed not only among those who considered Victorinus' work too obscure to analyze but it was an opinion even held by Paul Henry who in this decade has produced the critical edition of Victorinus' theological treatises. But it is precisely this critical edition<sup>1</sup> which has brought about a growing appreciation of the differences between the metaphysics of Plotinus and that utilized by Marius Victorinus the African.

In the Plotinian triad - the One, the *Nous* and All-Soul - there is subordination of one to the other; true transcendence is present only with the One, said to be utterly incommensurable with the other two Hypostases. Simplicity both characterizes the One and differentiates it from the other two. On the other hand, Victorinus has a perfectly clear metaphysics which supports the "consubstantiality" of the three persons of the Christian Trinity. The Father is *Esse*; the Son is movement or the act which defines this "*Esse*." This movement is a double one: a movement of "life" and a movement of "knowledge". Life is that movement by which *Esse* or "to-be" communicates itself; knowledge is that movement by which it returns to itself. Father, Son and Spirit are consubstantial because as *esse*, life,

and knowledge they are mutually implied. In virtue of this mutual implication, life and knowledge are originally confused with *esse* (to-be) or substance; each one of these is the other three; on this position Victorinus bases consubstantiality. The distinction between Father, Son and Spirit proceeds from "predominance." Each one is all three but gets its name from that which predominates. Thus, the Father is more characteristically "to-be" (*esse*); the Son is "to live" (*vivere*); the Spirit is "to know" (*intelligere*). This predominance has to be understood as "dynamic"; in each case it is an action which predominates: the Father exists; the Son reveals the Father: the Spirit returns all to the Father.

This philosophical trinity of Victorinus with its care for equality and consubstantiality is not to be found in the *Enneads* of Plotinus although it is present in the Hymns of Synesius.<sup>2</sup> The Neoplatonic source seems to be Porphyry, for apparently a similar triadism was present in Porphyry's *Philosophy of Oracles*<sup>3</sup> referred to by Augustine in the *City of God* as *de regressu animae*; (The Soul's Return). It has been suggested by Professor O'Meara of Dublin that the latter name was given it by Victorinus when he translated it from the Greek into Latin. Furthermore, it may possibly have been among the books of the Platonists read by Augustine in the Latin version of Victorinus just prior to Augustine's intellectual conversion. Theiler thinks so.<sup>4</sup> This work has as its main point the soul's return to the intelligible world. It contains, moreover, an extended exegesis of the Chaldean Oracles.<sup>5</sup> This was probably because Porphyry was stressing that the sacraments prepared by the Chaldean Oracles were not capable of assuring a perfect purification of soul, that only a flight from the body, advocated as it was by Plato and Plotinus, could assure definite salvation to the soul. The deep epistemological reason for this was to be found in the Platonic doctrine of "knowledge by likeness"; a progressive de-materialization was needed for men to be able to approach the Principles which are purely incorporeal - the Triad of Father, Will and Intellect. In the tenth book of the *City of God* (ch. 23) we find this Porphyrian exegesis of the Oracles: the Father and the Begotten of the Father: Paternal Will and Mind. Augustine speaks of this triadism as obscure and incomprehen-

sible. He knows it but does not follow it in his own *De Trinitate*. He is, in addition, quite aware that this is not the triadism of Plotinus. From Augustine we learn that Porphyry

... says, too, in the same place that "principles" can purify, lest it should be supposed, from his saying that sacrificing to the sun and moon cannot purify, that sacrificing to some other of the host of gods might not do so. And what he as a Platonist means by "principles" we know. For he speaks of God the Father and God the Son whom he calls the intellect or mind of the Father; but of the Holy Spirit he says either nothing, or nothing plainly, for I do not understand what other he speaks of as holding the middle place between these two. For if like Plotinus in his discussion regarding the three principal substances (*Ennead* V, 1), he wished us to understand by this "third" the soul of nature, he would certainly not have given it the middle place between these two, that is, between the Father and the Son. For Plotinus places the soul of nature after the intellect of the Father, while Porphyry making it the mean, does not place it after, but between the others. No doubt he spoke according to his light, or as he thought expedient; but we assert that the Holy Spirit is the Spirit not of the Father only, nor of the Son only, but of both.

Porphyry's problem, after he decided to accept the authority of the Oracles, was to explain how "life" and "intelligence" could pre-exist in the First God when Plotinus had denied any duality or plurality within the One. He found in the Plotinian *Nous* (influenced by Numenius)<sup>6</sup> the paradigm for a unity of being, life and thought. He then used Stoic physics<sup>7</sup> with its outgo and return to unity by transforming it into a metaphysics of Intelligible Reality. He preserved both Plotinian unity and Stoic expansion in distinguishing two states or rather, moments of Intelligence: repose or interiority and movement or exteriority. This reciprocal interiority of the parts of the intelligible world was able to save Plotinian unity while it would also help Victorinus in his defence of the cause of consubstantiality as defined in the Nicene Creed.

This metaphysics of Porphyry was apparently formed by the confronting of certain expressions of the Platonic *Parmen-*

ides with certain formulas of the Chaldean Oracles.<sup>8</sup> This re-interpretation of Plato through the authority of the Oracles led Porphyry to transform the triadism he received from Plotinus. This was a momentous decision in the history of philosophy. The distinction between "esse" and the existent which Porphyry seems to have been the first to propose in a fairly explicit fashion does indeed depart from the metaphysical past. It makes Porphyry the predecessor of the Pseudo-Dionysius, of Boethius, of John Scotus Erigena, of that emphasis upon the primacy of *esse* which is found in medieval metaphysics. Not only medieval thought, however, but surely modern philosophy shows by a study of Nicholas of Cusa, of Schelling, of Hegel the Neoplatonic influence here analyzed.

The opinion is now strongly advanced that it was under the influence of Porphyry rather than of Plotinus that Victorinus became the author of the first metaphysical treatise in all Latin literature. He (Victorinus) may indeed be the key which assists us to unlock the full metaphysical significance of Porphyry's contribution, but he is far from being the sole channel of Porphyrian thought. Chalcidius in writing his 4th century *Commentary on the Timaeus* used Porphyry's own commentary on that dialogue. Porphyry also survived in the *Isagoge* which Victorinus translated into Latin in 360 A.D. and which was used at first by Boethius. Macrobius in his *Dream of Scipio* shows the influence of Porphyry's *Commentary on the Republic*, on the *Timaeus*, *On the Return of the Soul*, *In the Sun*. It certainly seems that it was Porphyry rather than Plotinus who was the point of contact between Latin philosophers and Neoplatonism.<sup>9</sup> Perhaps the proper interpretation of Porphyrian metaphysics was interfered with by being channeled to the Middle Ages largely within the Aristotelian framework operating in the works of Boethius.

If Porphyry was trying, as Pierre Hadot thinks he was, to interpret in Plotinian terms the "revelation" of the Chaldean Oracles which, written in the second century, contained Platonism strongly touched with Stoicism (Middle Platonism), he could not really end up on the side of Plotinus whose First Principle was said to be without life, without thought and whose "One" gave what-it-had-not inasmuch as the Oracles

affirmed a First God with life and thought, giving all it had. But perhaps Porphyry provided the metaphysics which allowed room for both the negative and the positive theology of Plotinus in the Fifth and Sixth Enneads. The negative theology is well-known. We may remind ourselves of the affirmative by reviewing those Plotinian passages where Plotinus seems carried away by the truth:

Our inquiry obliges us to use terms not strictly applicable: we insist, once more, that not even for the purpose of forming the concept of the Supreme may we make it a duality; if now we do, it is merely for the sake of conveying conviction, at the cost of verbal accuracy.

If, then, we are to allow Activities in the Supreme and make them depend upon will - and certainly Act cannot There be will-less-and those Activities are to be the very essence, then will and essence in the Supreme must be identical. This admitted, as He willed to be so He is; it is no more true to say that He wills and acts as his nature determines than that his essence is as He wills and acts. Thus he is wholly Master of Himself and holds his very being at his will. *Ennead VI, 8, 13.*

And also:

Lovable, very love, the Supreme is also self-love in that He is lovely no otherwise than from Himself and in Himself. Self-presence can hold only in the identity of associated with associating; since, in the Supreme, associated and associating are one, seeker and sought one - the sought serving as Hypostasis and substrate of the seeker - once more God's being and his seeking are identical; once more, then, the Supreme is the self-producing, sovrän of Himself, not coming to be as some extern willed but existing as He wills it. *Ennead VI, 8, 15.*

By a more fundamental metaphysics, a metaphysics of being rather than of unity, Porphyry provided that identification of being with activity which enabled the First Principle to be by its infinity without possibility of predication and yet self-productive by its activity. The fidelity to this deep insight of Neoplatonism that the maximum of universality as indetermination is a maximum of activity and force enabled Porphyry

to justify much of what Plotinus says informally of the One in *Ennead* VI, 8, 13 and 15.

Victorinus followed Porphyry in placing act before substance. This was originally accomplished through that union of Stoicism with Platonism referred to above. Stoic substance, endowed with tonic movement, placed itself into motion. "Being" (*esse*) rendered as an infinitive is seen to be self-moving: it lives and it knows. That which differentiates the Neoplatonic Intelligible World from the Platonic or Aristotelian one is this dynamism of mind (found later in Hegel). Action which for the Stoics was the accident of bodies became with Porphyry a Subsistent Principle. The Mind transcends its determinations. Husserl's Transcendental Consciousness is incipient here. Transcendence of mind is seen as a law of being, not merely of thought: this is a metaphysics, not an idealism.

In Porphyrian metaphysics the first moment of the Intelligence coincides with the One;<sup>10</sup> this signifies that in its origin, in its principle, the Intelligence, or Mind is One itself. The second moment is a self-generation, a self-movement, a self-manifestation by which the mind is exteriorized in life and thought, in living thought. The One also has this double aspect; as the Absolute it is alone and incommensurable with the triadic Intelligence, but it is also the Intelligence reduced to its first moment. *Being* in repose and action explains both transcendence or unity and productivity or trinity.

Now, Pierre Hadot has well shown that the doctrinal incoherences in the plan of Victorinus' theological treatises point to the presence of purely philosophic developments placed here and there throughout the books and poorly connected with the whole work.<sup>11</sup> These doctrinal and philosophical "constants" as well as the Greek vocabulary<sup>12</sup> come from Porphyry. This particular set of doctrines found loosely situated in the writings of Victorinus is to be found also within the *anonymous commentary on the Parmenides* discovered in the late 19th century at Turin and recently attributed by Hadot to Porphyry.<sup>13</sup> The structure of the trinity in Victorinus and of the triad in this Commentary is identical: an initial state of immobility which is pure "to-be" (the Father), an Outgoing movement which is life, otherness, infinity; and finally a

movement of self-knowledge, of return which is thought. Each of these terms implies the others: the self-generation of Intelligence is triadic; life is triadic. This Porphyrian triad is an ennead. Since they are three times three, they are One. Life was placed between the Father and the Son. When Victorinus takes up this triad, he makes the Spirit a feminine entity between the Father and Intelligence or Son. (*Adv. Ar.* I, 51, 19).

The use of the Porphyrian triad - *esse, vivere, intelligere* - by Victorinus was able to safeguard intellectually the unity of God, i.e. the consubstantiality of Father and Son and Spirit challenged as it was by Arius, but was it really an analogy that could be faithful to the relations within the Trinity?

Apparently Augustine was not satisfied with this first metaphysical treatise on the Trinity in the West. He opened his mind to the thinking on the Trinity done by the Greek Fathers and when in 415 he began his own fifteen books *On the Trinity* he sought within the human soul for analogy after analogy which could better reveal the relations between Father, Son and Holy Spirit as these were revealed in the Sacred Scriptures. Because Porphyry never cited the text of the Chaldean Oracles we cannot be sure whether he was guided by the Oracles in working out his philosophy or whether he interpreted the Oracles as he did in agreement with his own systematic interpretation of the Parmenides dialogue.

Augustine had other major disagreements with Porphyry, to such a degree that Pierre Courcelle can say:

The apologetics of the *De Civitate Dei* were addressed to Porphyry's disciples, who were so numerous in the cultured circles of Africa. Entrenched in his own experience he [Augustine] showed them the harmony that impressed him, at his conversion, between Neoplatonic doctrine and Christian dogma. St. John's prologue and the *Enneads* preached the Word of God. The dogma of the Trinity recalled the doctrine of the three hypostases, which Plotinus and Porphyry supported each in his own way. The dogma of Grace was clearly taught by Porphyry. Is it necessary to go further, like those Christian who were to find in Plato the dogma of the resurrection of the dead? Augustine did not think so (*De Civ. Dei.* XXII, 28;

Eusebius *Praep.* XI, 33), for after long years in the episcopate he perceived the irreducible oppositions that distinguished Porphyrian philosophy from Christian dogma. The incarnation of the Word, the resurrection of the flesh - these problems were a scandal to the Hellenes, so profoundly did they scorn the body in pride of spirit.<sup>14</sup>

But while we note the theological contradictions we must note the metaphysical originality of Porphyry. Even if Augustine's efforts were rewarded to the extent that his *De Trinitate* has become the standard work on the Trinity in the Christian West so that Aquinas added little to it, this should not obscure the greatness of the first step taken by Marius Victorinus the African when from Porphyry he accepted and worked with the First Principle as *Esse* and for the first time designated Being as activity, simple and infinite, a Principle from which substance is constituted. This Porphyrian analysis, even if it did remain literally faithful to the Chaldean Oracles and unfaithful to the declared teaching of Plotinus, yet rendered philosophic justice to that Plotinian Intelligible World where all is Life! But what Porphyry explicitly added was the insight into being as fundamental. In this respect he became the originator of a new metaphysics. After him Boethius will indeed say that the "to be" of things is derived from the divine to-be. Because the philosophical world has only recently become aware of all this, it can be truly said that many histories will need to be revised.

# Schelling's Neoplatonic System-Notion: *'Ineinsbildung'* and Temporal Unfolding

by Michael G. Vater

*Marquette University*

## I

It is difficult to document the full influence of Neoplatonism upon the development of Schelling's thought, for he is a philosopher at once original and eclectic, situated in his own time and yet able to think within the inherited traditions. His 'Neoplatonism' is more a matter of affinities holding between his thought and the themes and preoccupations of the Neoplatonists than one of bookish or directly textual inheritance.<sup>1</sup> Early in his speculative career his contact with Neoplatonism comes through Spinoza and Leibniz, particularly the former. He is in contact with the 'tradition' from the start, but it hardly need be said that the 'tradition' has very little of the text and spirit of Neoplatonism about it after it has passed from Proclus to the Areopagite, from Dionysius into all of scholastic thought and finally come to light again in Spinoza. Schelling did not read Plotinus, not seriously at any rate, until 1804<sup>2</sup> and he did not begin to make contact with the text of Proclus until 1820.<sup>3</sup> Even then his acquaintance with Neoplatonism is fragmentary, more speculative than scholarly. This indeed is Schelling's typical style of thought. Most of his positions and the dynamic of their growth spring from the contemporary philosophical arena. In his younger days, prior to 1801, his wrestling with Kant and then Fichte about the limitations of a "*Reflexionsphilosophie*" shapes his thought. Later in life, after 1820, the

conflict with Hegel (and with his younger self that authored the System of Identity) over the limitations of reason itself is determinative. Typically Schelling will range historical precedents and justifications around these contemporary conflicts, and treat them with quite a free hand. Usually the Platonic traditions are assimilated to Schelling's own positions, and not just in one period but throughout the whole course of development of his central and all-determinative problematic—the confrontation of reason as philosophical system with intractable individuality, with facticity.<sup>4</sup> Platonism alone seems to have a philosophical language, a way of getting beyond the fragmentary and expressing the eternal, or rather, it is a model of thought guided by intellectual intuition bending the “patch-work of our language” to philosophical employment.<sup>5</sup> Platonism alone stands outside of the snarl of discordant but equally erring positions which makes up modern philosophy; it alone escapes ‘Reflexion’ and stands inside the truth.<sup>6</sup>

Schelling's respect for the Platonic and Neoplatonic traditions is not abstract; he sees himself living within the tradition, thinking its thought. It is no accident, then, that at the most crucial stage of his philosophical formation, the point where he feels he has achieved a satisfactory grasp upon ‘system’ and elevated philosophy above Fichtean subjectivity and reflexion, he announces the claim in Neoplatonic guise. The dialogue *Bruno* of 1802 represents historical Neoplatonism in the person of Anselm as the philosophical synthesis of all the conflicting traditions of ancient thought, the radical pluralism of materialism and the radical monism of Eleatic thought; Neoplatonism alone is conceptually inside the mystery which beauty shows and demonstrates, the unity of the divine and the natural, the intertwining of the eternal and the insubstantial individual through the mediation of ideas in their productive or ‘psychic’ function.<sup>7</sup> In the same way, the dialogue represents in the person of Bruno the philosophical synthesis of the modern world, the reconciliation of idealism (Fichte's *Wissenschaftslehre*) and realism (Schelling's philosophy of nature). Schelling repeatedly stresses the cognate nature, even the continuity, of the two syntheses; just as Neoplatonism bound the disparate worlds of sense and spirit together through the notion of ideas

and the illusory or autolimited character of the finite, so the System of Identity combines realism and idealism, at one and the same time saves the concreteness of philosophy and guarantees the comprehensiveness of its systematic grasp.<sup>8</sup> Schelling perceives himself as taking up and continuing in *pertinent terms*, the questions namely of philosophical *Wissenschaft*, the Neoplatonic problematic of system and structure—the question of the reconciliation of opposites, of the ingathering of the fragmentary and (on its own terms) inexplicable into a world, of the restoration of psyche to its appropriate level of functioning.

Schelling puts on the person of Giordano Bruno, then, and represents himself as the modern Neoplatonist, even though his knowledge of Bruno was scant and entirely second-hand.<sup>9</sup> Neoplatonism means for him above all *systematic* thought, speculation which reconciles, integrates, harmonizes and achieves a point of view transcending conflict and opposition. In this sense all systematic philosophy is ‘Neoplatonism,’ the conceptual ascent to the vision of the eternal or the Absolute within the dialectic of the finite and the infinite, the isolated thing and the conceptual order.<sup>10</sup> The sole object of all philosophy is “the Idea of ideas”—the union of the universal and the particular, of species and individual, the Idea which is in itself “the undividedness of the already differentiated from the One.”<sup>11</sup>

The *Bruno* is not an isolated instance. Since his earliest speculative days as a disciple of Kant and Fichte, Schelling had thought along the lines of the Neoplatonic problematic of the unity of being. The task was to bring Criticism to the status of system, to make it science or the mutual interpenetration and reciprocal determination of form and content.<sup>12</sup> In 1801, with the first announcement of the ‘System of Identity,’ Schelling lays claim to a comprehensive structural grasp of the totality of phenomena, to a system grounded in the ultimate non-difference or togetherness of a substantial unity like the Neoplatonic One and the structures of subjectivity-objectivity which scientific analysis of phenomena reveals.<sup>13</sup> The *Presentation of My System* is deeply stamped with both the methodological and structural rigor of Spinoza,<sup>14</sup> and the notion of

togetherness of being through structure, of identical articulation in the real and in the ideal working a total congruence of philosophical knowledge and reality, continues the tradition of Neoplatonism as transmitted from Proclus to Pseudo-Dionysius to Aquinas and come to flower again in Spinoza and Leibniz among the moderns.

Schelling is not a 'modern Neoplatonist' in that he adopts a classic notion of system. Rather he attempts to think the notion of system, and to be guided by reason's *demand* for system. It is not any achieved system that draws his speculative attention, but its *possibility* in a unified and intelligible world and its *necessity* for the shaping of such a world in concepts.<sup>15</sup> Thus in the System of Identity we identify the Neoplatonic influence not so much with any imitation of a type-ektype metaphysics or any mirroring of orders of procession and reversion as with the concern for apprehending being as structured, thus ultimately graspable as a whole. It is because his guiding problematic is the Neoplatonic search for the inner order and coherence of being that Schelling's system takes on typically Neoplatonic forms in its unfolding. For it is the demand of systematizing reason that isolated particularity give way to integral totality which raises the Platonic question of the legitimacy of the finite, which suggests that the only individuals containable within the system are purely formal or structural instances of the system-principle (identity)—these are the "Potencies" or groupings of beings akin to Neoplatonic hypostases, later the "ideas" or universal individuals—and which finally sees individuation or the multiplication of the finite as an ultimate surd, a "fall" from the rationality of system.<sup>16</sup> And it is the system-demand which pushes Schelling beyond the formal System of Identity, its confrontation with the ultimacy and permanence of individuation that forces his turn to the philosophy of spirit developed 1809 and thereafter.

## II

It would generally be more useful in establishing the Neoplatonic trend in his thought to contrast Schelling's precise system-notion with its historical Neoplatonic counterparts

rather than merely indicate affinities.<sup>17</sup> The Neoplatonic system grew out of a definite world and in response to definite problems and it is obvious that any use of Neoplatonism, even any attempt to rethink its fundamental problematic along with it, must leave this determining context behind. We shall understand more of Schelling's Neoplatonism, especially his concern for system, if we make quite clear how it differs from the historical models Plotinus and Proclus provide.

The basic impulse to system is a will to wholeness, to totality of grasp, to a conceptual outworking of a unity of being. For the historical Neoplatonists the possibility of this unified grasp of being lies in being itself, on the side of the objective. A basic sense of the term *τὸ ἐναι* for Plotinus, for instance, is that kind of order, coherence and organic unity necessary for there to be a world. Being is the possibility of *cosmos*.<sup>18</sup> For something to be, in a pertinent sense, is for it to be capable of taking its place in a world (or system), to be "in the intelligible" or to be in that which is a cosmos in virtue of its dependence upon the intelligible. Being also signifies, or is at least synonymous with, organism or living totality; at the appropriate level of being, as Plotinus sees it, intellection and life and existence all coincide, viz. in *noûs*.<sup>19</sup> Being is a living whole, and the task of system is to apprehend it as such, through the discovery of the lines of outpouring unity and epistemic-psychic reunification, through the discovery of structure.

Proclus, though insisting upon linearity of structure more than Plotinus, is no less intent upon thinking the Whole as organically united. With his emphasis on causality and participation he brings to light more forcefully than Plotinus the ancient world's demand for unity and finitude as the defining parameters of system.<sup>20</sup> For Proclus system is or reflects the work of causality; all that exists is gathered into a Whole through structures of asymmetrical relation or subordination. Sequence is subordination, and all our logic, consequently all our knowledge, is grounded in that differentiation-in-continuity which sequence bring about, namely causality.<sup>21</sup> Causality unifies; sequence leads back to an origin, a first. The system, a reflection of the work of causality, leads the totality back to unity.

For the Neoplatonists, then, the chief category behind the system-notion is unity. Now Schelling indeed shares this taste for the organic integrity of being, but thinks it not through unity alone, but through a dialectic of *unity and totality* in which ultimately abstract original unity proves to be a vanishing moment.

The category of totality is the key to Schelling's system-notion. He is a philosopher in the transcendental tradition and conducts his metaphysical inquiries from the vantage-point of the question: How is a world possible for me? For him system is not merely a unified accounting of a pre-articulated whole of being, not ■ total enumeration of the given, but the totalization of being as it is articulated inside *Wissenschaft*. It must be imagined as in some sense active and processive, through not in any discursive way, since it is not a matter of dividing off item from item but of moving within the whole. "One cannot describe reason; it must describe itself in everything and through everything."<sup>22</sup> Only for systematic reason is there a universe. The totality is unified only in being brought to the unity of the Absolute in reason, and yet that unity or Absolute Identity *is* and *is real* only as totality. "Absolute Identity is not cause of the universe, but the universe itself."<sup>23</sup>

Schelling's system-notion is generally distinguished from that of the Neoplatonists in three ways: (1) Schelling's system is committed to *unity and totality*, and he will in no way allow the Whole to be thought away for the sake of the One; (2) he refuses to think the unity-totality relation through any thing-oriented or thing-modelled schema such as part-and-whole; (3) he denigrates causality to a merely phenomenal linkage, a bridge between appearances and itself an expression of an unbridgeable gulf between actuality and possibility.<sup>24</sup> Structure, the backbone of system, is not unidirectional asymmetrical relation (like subordination and causality) but is reciprocity, coordination, the commutation of opposites. The stamp of Fichte's influence upon Schelling is evident here: Causality links appearances, but reciprocity links, or strives to link, the opposed metaphysical orders of subjectivity and objectivity.

Schelling's system-notion is further distinguished from the Neoplatonic sources in its fundamental direction. For Schelling,

unlike the historical Neoplatonists, theory overtakes and comprehends praxis. There is no goal or purpose for system extrinsic to itself, no life-goal for whose sake system is pursued. The will to system is first and foremost an affair of knowledge, or to put it somewhat differently, *knowing* is the decisive act of spirit, the act in which spirit is most 'about itself,' and it is not in any way for the sake of any finite thing, act, or even self. Schelling insists, therefore, that systematizing knowledge, philosophy constructed in "intellectual intuition," as he calls it, is not characterized by subjectivity or centration upon a 'self,' but rather by an abstraction from subjectivity, an 'ecstasy' or abandonment of self.<sup>25</sup> "That I say, 'I know, I am the knower,' this is the *πρῶτον ψεῦδος*."<sup>26</sup>

The knowing which Schelling considers constitutive of system is indeed act; it is the work of will—but not of will centered and particularized (*Eigenwille*); rather it is general will, *Verstand*.<sup>27</sup> It is this type of comprehending activity of man as spirit, at once both a knowing and a founding, which Schelling termed *intellectual intuition*. It is the organ of *Wissenschaft* or systematic philosophy and it defines system's stance as primarily theoretical. Later in the *Philosophy of Freedom* Schelling redefines intellectual intuition and maintains that the activity constitutive of system (the temporal division and reconciliation of the opposed principles, Ground and Existence) delivers man back to his primal status as the Word, the expression of the Absolute, at once the medium of and the witness to Creation. Since he is at the center of being and like to that center, man as spirit carries a con-science (*Mitwissenschaft*) of the Creation; all things are contained in that knowledge and man does not so much know them in it as he is *himself that science*.<sup>28</sup>

In Schelling's eyes, then, system is a self-enclosed, self-founding theoretical whole. System is self-bearing, self-containing, and even of the static System of Identity it is not inaccurate to suggest that in some sense system is subject, the self-enactor.<sup>29</sup>

In the System of Identity Schelling sees system, or the Absolute which system in ■ sense creates and in a sense reflects, as a theoretical or conceptual enterprise which consists in the

equilibration or indifferencing of the subjective and objective aspects in all real beings. The primal or substantial being is Identity. Its formal or cognitive character is subjectivity-objectivity. And the work of system is to identify or balance out knower and known in things, to reduce them to a structure of subject-objectivity and incorporate them within identity. System takes its origin in intellectual intuition, the indifference of knower and known, and *proves* out that indifference in the totality of phenomena. It is the establishment of intellectual intuition, its concretion, the revelation that the structure it represents at first abstractly as the 'identity of the differentiated' actually structures the world and brings it to 'system' or togetherness in the conceptual.<sup>30</sup>

In the course of Schelling's development there is a crucial change in the way he conceives system, a change coincident with the shift of his intense interest from philosophy of nature to philosophy of spirit between 1806 and 1809. While in the perspective of the Identity-System spirit and subjectivity were seen to *dwell within* system's comprehension and to be innate in system's self-movement, with the *Essay on Human Freedom* the perspective is reversed and system becomes the decisive act of spirit, the product of freedom's conquering over the facticity of the Ground, the effect and the instrument of Ego's ultimate conquering of Non-Ego in the historical and world-creating division and reconciliation of being.<sup>31</sup> Spirit's life is now seen to be the production of system and structure, the subjugation of nature to history, the rescuing of intelligibility or "world" from facticity. As different as this notion of spirit's activity is from the stasis of intellectual intuition in the System of Identity, the fundamental system-notion has not altered. 'Spirit' which decides the structure of being in its activity is not subjective, centered upon a self, but is the original subject, the locus of *θεωρία* or the conscience of Creation, the agent active in intellectual intuition.

The basic impulse and direction of the Neoplatonic system-notion, in contrast, is toward praxis, toward the definitive establishment of the subjective as the core of being. In both its Plotinian and Procline forms it bears the stamp of Socratic-Platonic interiority; system is not for disinterested

contemplation, but for actuation of the self. While the conceptual or theoretical burden of Neoplatonic system is the founding of the togetherness of *μέθεξις* and *ἔρως*, the equilibration of the ontological and the psychic order or the orders of procession and reversion, ultimate philosophical interest is centered upon psyche and its reintegration into the true order of being.

For the Neoplatonists being has already unfolded itself into a structured Whole, a Whole, however, which is less than its origin. In some sense the process of production is falsity, the establishment of being upon the basis of non-being, and the only *use* of the articulated structure into which being has unfolded in its going-forth is to undo the complexity, to reascend to simplicity and unity. In Plotinus, for instance, the chief interest is psychic rather than metaphysical; his concern is for elevation, transcendence, conversion, union with a substantial Absolute, and *not* the further discernment and expression of structure in the world which is Schelling's concern. Even for Proclus, seemingly obsessed with the outworking of a mechanical causality in the cosmos, the whole point of structure is the possibility of psychic return. The meaning and importance of procession is reversion, and it is only this possibility of inwardness and self-concentration at every level of being which rescues any multiplicity from utter dispersal.<sup>32</sup> For both Plotinus and Proclus the goal of philosophy is practical and religious, the actuation of self—or rather the de-activation of that dependent and outward self which moves among imperfectly unified multiplicities.

For Schelling system is creative of world; for the Neoplatonists it holds out the possibility of transcending the world. As Schelling's thought evolves from 1794 to 1821 (the beginning of the Late Philosophy) the notions of expression, bringing into the light, the issuance of godhead into creative divinity more and more dominate his system-notion. Intellectual intuition becomes more outgoing, manifestive, productive. It recovers its original Kantian sense of a creative or constitutive act of knowing.<sup>33</sup> System becomes ex-expression, the mirror of divine Creation. In Plotinus, by way of contrast, knowledge is always introverted, secretive and restorative, a struggle back through externality to unity—ultimately to the One, to the Unmanifest.

## III

An examination of the exact meaning of 'structure' within the system-notions of Schelling and the Neoplatonists and an analysis of their respective models of structure (*Ineinsbildung* and hypostasis) strengthens the impression that Schelling pursues the Neoplatonic system-problematic in a way markedly different from his historical predecessors.

For Schelling structure is the work of intellectual intuition, a knowing in which the subjective and objective are balanced-out, brought into equipollence, but not abolished as opposite.<sup>34</sup> Structure originates in reason's activity, then, or grows out of the root presupposition of any knowing that there must be a convergence of knower and known,<sup>35</sup> and it proves itself out or legitimates its function of articulating being by making system possible, by facilitating the philosophical 'construction' of the world. Through the indifference of subjectivity and objectivity in intellectual intuition a *world* is first made possible, a grasp of the differentiated finite particulars in all the orders both of nature and spirit such that their *community*, *interdependence* and radical *ontological* sameness are made to appear. Each particular is revealed to be, at bottom, not an independent substance but an *instance* of substantial Identity (which as expressed or manifest in 'form' is subject-objectivity). The opposition of nature and spirit is shown to be only relative, as is that of object and subject; they are indifferential structures differently indexed or overbalanced, only directionally opposed then, equally grounded in the indifferential relationality which is at once the standpoint, agent, and presupposition of intellectual intuition.<sup>36</sup>

System is all a matter of like knowing the like, i.e. of spirit moving in intellectual intuition, or abstraction from subjectivity, recognizing the same structural equipollence of opposites which is its life in knowledge as the founding structure of all things transparent to knowledge and able to be brought to system. This indifference in knowledge—the non-ultimacy of the subject-object distinction—coincides with and mirrors the substantial Identity at the basis of things. Indifference means the non-difference of knower and known, that, without any abrogation of their opposition, what the one is, the other is also.<sup>37</sup>

As Schelling conceives it, indifference characterizes not only the differentiated unity of subject and object *inside* knowledge, it determines the convergence of knowing and being as such. The 'form' of the Absolute—that is, its infinite position as differentiated subjects and objects in a world—is indifferent with its substantial or in-itself aspect, absolute Identity, and thus it is that system is possible.<sup>38</sup> Structure is discoverable *in the world* because, on one side, knowing is articulation or the imposition of structure, and because, on the other, being is already articulated, because at its most substantial level, it is a knot of identity and difference open to the glance of reason. Thus every being is an instance of indifference, fundamentally alike, or comparable with, every other being; structure recurs throughout the whole and makes possible groupings, totalities; every being recapitulates all others.<sup>39</sup> This way in which the articulation of thought and the articulability of being as structure dovetail into one another makes it apparent why Schelling's dominant image of the work of system-building reason is speaking, expression. *System is language*; spirit speaks in the world; reason discovers the intelligibility of the given and makes it into a world. In its active aspect as expression, as spirit, it is self-affirmation, the expressed bond between all things, a stamp which imprints its own character on all it comes into contact with, the "All-Copula." In its objective aspect, it is system.

Whereas Schelling's notion of system-structure derives from the subject-object polarity discoverable in knowing, for the Neoplatonists structure is basically a matter of the interrelation or derivation of beings, objective entities not wholly dependent upon structural relationships for their being, in some sense substantial in their own right. Structure, the possibility of system, is conceived ontologically. It is not an affair of the psyche and its realms of experience, but of the relations which obtain between beings on account of *production* and *derivation*. There is a general and comprehensive order of relations which beings have as beings or as hypostases come-to-stand in virtue of transcendent Unity, and this objective order of relations determines and circumscribes the place of subjectivity, even of that intellectual act above psyche which is

like what Schelling called subjectless intellection or intellectual intuition.

Determinative of the Neoplatonic cosmos, then, are not the ways of thought but certain abstract and objective principles—we might call them principles of integrity, sufficiency and power. Every integral being is productive, and every kind is linked to lesser kinds through production, maintains Plotinus, and this kind of linkage through production is virtually the only generalized and non-metaphorical attempt at explaining the process of hypostasis he makes.<sup>40</sup> Proclus takes over the same explanation as the chief principle of procession, holding that a being which has power necessarily acts to the utmost of its power and *produces*, or else it is sterile and imperfect.<sup>41</sup>

Production is not simply the communication of being and unity, though. The responsibility for there being further hypostasis beyond any given level of production involves a possibility of return, a possibility of re-centration. The full system-notion is production *and* return, procession and reversion, i.e. there is a gatheredness of being because all beings have a common origin and derive from one another in sequence *and* can return to that unity and in fact do strive toward that unity as their end.

As the Neoplatonists conceive it, there must be something of a lack in production, at least on the side of the produced or derivative hypostasis. For it is only such a lack, such a dependence on the prior whence a being derives its (relative) independence, which can compel an eventual turning about, a turning inward. Reversion is in some sense an undoing of production, a reflection on the Neoplatonists' part of the primitive Platonic feeling that spirit is somehow lost in the world, even a world gathered into an ordered and graded totality of perfection. We might say that there is at least one aspect of production which is a lessening of perfection and integrity, so that, at best, it is neutral or accidental that being has gone forth from unity, that differentiation has occurred.<sup>42</sup>

When contrasted with Schelling's notion of system as expression, as world-creating, there appears to be a kind of introversion in the Neoplatonic system-idea of production. The

actualization of the further possibility for being which production represents is in fact a perfection only inasmuch as it is a perfection of the origin and producer. The Whole is perfected not by some further addition, some further expression and stabilization of the primal power, but by that power's self-containment as superior when being goes forth to further hypostasis. The concept of hypostasis means mutual externality in the outflow of productive power; it means that beings produce beings without the prior being touched, altered or in any way affected. There is a communication of being and integrity, and yet at the same time a distancing.<sup>43</sup> There is gatheredness of dispersed being or *κωκυλία* only through causal ranking and hierarchy.<sup>44</sup>

#### IV

We can proceed from this point to isolate the system-logic and determine the model of structure at work in Schelling's philosophy as contrasted with that of the historical Neoplatonists. The whole difference in their respective approaches to system will be formulable through a contrast between reason as commutation of opposites (*Ineinsbildung*) and the Plotinian idea of hypostasis as double-act.

We might analyze the differing system-logics in terms of a fundamental relation and the rule or operation of its application. For Schelling the relation is identity in intellectual intuition, the organic indifference of subjectivity and objectivity. The operation whereby it is applied is equilibration, commutation of opposites, the mutual in-and uni-forming of subjectivity and objectivity into one another. In reason's intuition the isolated particular is reduced to a formula, to an instance of differently indexed indifference. The overbalanced indifference of the isolated individual is balanced-out in relative totalities (the potencies) in both nature and spirit, and the cycles of recurring structure converge into an organic unity. Behind this whole activity of intellectual intuition is *Ineinsbildung*, commutation of opposites; it is only because of reason's ability to see one objective phenomenon, e.g. electrochemical reactions, as more subjective than another, say

magnetic attraction, that the whole structural viewpoint which is the basis of system can be introduced.

This *Ineinsbildung* is an intermediation of strict identity and the instanced identity of the universe, totality. Through this commutation the absolute Identity which is reason's postulate and fundamental law, hence the one *substantial* moment which must be conceived to underlie system, is reflected into and revealed in the totalized relative identities or points of indifferential structure which are the world.<sup>45</sup> As Schelling sees it, the One and the Totality not only coexist, but are of equal rank and priority, built into one another, ultimately differentiable not as substances but only as aspects.<sup>46</sup>

In the Neoplatonic system-logic the basic relation is the identity of self-relation or self-centration, which when instanced in pure form is sufficiency. This relation is imposed upon a kind of quantified, or better, geographical grid which combines the gradations from inner to outer, from one to many, and from more down to less one upon the other. The result is hierarchy, asymmetrical interdependence of beings—*cosmos* as a simple function of series and subordination. As Proclus especially makes clear, the structure of being is wholly vertical, simply transcendence-and-subordination. Hierarchy is established not organically and through replicative structure, but in terms of a single scale whose defining terms are either simplicity or dispersal of ideally self-centrating activity.<sup>47</sup>

The Neoplatonic system-notion has built into it an irrevocable commitment to particulars and to substantiality, however much its basic impulse, working toward a community of being, demands the sublimation of the externality of objective being into that inwardness in which psyche at its fullest powers moves. Schelling's notion of the systematizing power of reason involves, on the other hand, a commitment to overcoming particularity, to abolishing the substantiality of the individual and to the redefinition of 'the substantial' in systematic terms, i.e. as a function of totality and structure.

The two system-notions are indeed similar, for system is, after all, a thorough-going interconnection and interrelation of particulars, no matter how accomplished. They are similar, but

do not coincide. And a final comparison of the ideas of *Ineinsbildung* and hypostasis will show that for Schelling, system is dependent upon overcoming individuality as such, while for the Neoplatonists it is dependent upon the maintenance of differentiation through order and hierarchy.

Both Plotinus and Proclus, when they speak technically of hypostasis, talk not only of production or *περιλαμψις* or participation but of a certain double-functioning or double-power constitutive of each being on each level of being which guarantees both production and differentiation of levels. Proclus states the idea rather baldly at first: "Every productive cause produces the next and all subsequent principles while remaining steadfast within itself,"<sup>48</sup> glossing over the question of power, act, and communication of actuality with his as yet uninterpreted notion of causality. Later he remarks that causality is possible only because the nature of power (*δύναμις*) is twofold. There is an active and a passive sort of power, and the two are interlocked so that all coming to be is an interfunctioning of the two, the one power active and so 'causative,' the other an imperfect power and so merely potential or dependent upon the former for perfection.<sup>49</sup>

This double-power schema is a translation of Plotinus more unwieldy (and infrequently employed) notion of hypostasis as a double-*ἐνέργεια* into Proclus' typical language of causality. The clearest instance of the Plotinian notion occurs in *Ennead* V. 4. 2: 26-37:

...But how can an act of intellection come to be if this primary intelligible remains in itself? We must distinguish two kinds of act, one of which is *of* each substance itself, the other of which is *out of* that same being. The first activity of the being is identical with the being itself; the one from it and out of it, necessarily following upon it, is something different from it ... From the one act remaining in its native place and element and reaching its fulfillment there, comes a begotten activity, intellection, which takes hypostasis. Since it comes from the greatest of all powers it attains to full being and substantiality.<sup>50</sup>

This notion of double-functioning is Plotinus' device for translating the *ὄντα-εἰδωλα* structure of Platonic ontology into

metaphysical categories incorporating the dynamism and stress on organic coherence of Aristotle's ontology. The quality of life, which Plotinus so characteristically associates with substance or being, expresses the basic capacity of anything real to produce an image that is living, an offshoot that attains to hypostasis in its own right.

And yet hypostasis remains a process of individuation more than one of communication; it is centration, concretion of activity to hard particularity. Hypostasis is defined from the point of view of production, a category of objectivity, and so can have that life and intermediation which Schelling suggests in the idea of commutation or *Ineinsbildung* only derivatively. All the relations which define hypostasis are vertical, whereas the dominant idea in Schelling's distinguishing a 'substantial' and 'formal' aspect of the Absolute, in his making its life their inbuilding, is that of *reciprocity* or a *play* inside systematic knowledge (and inside its point of origin, intellectual intuition), a movement at once vertical and horizontal, a movement that defines a structure for the phenomenal world, but does not abolish its concreteness in doing so. The activity of systematic reason in its inbuilding, in its play, encompasses and comprehends all isolated factors, brings them together for the first time into a cosmos.<sup>51</sup>

This play of inbuilding opposite aspects into one another is what Schelling calls the 'formal' aspect of the Absolute, that element responsible, as it were, for its self-knowledge. This 'form,' already a process of inbuilding subjective and objective tural basis for all, builds itself into the Absolute's substance—pure Identity—and in turn reflects that identity in its processes of integration.<sup>52</sup> Form or *Ineinsbildung* conquers over substantial identity inside systematic knowledge, over the unmanifest and unarticulated Neoplatonic One. *Ineinsbildung* thus is in one sense the destruction of what is ontologically prior, pure unity, and in another sense the reconstruction or 'saving' of that unity on the level of spirit's own identity—its own bridging life of knowledge which bring isolated particulars into a world, which is not content with externality and sequence, but demands organic unification.<sup>53</sup> It is a movement from being to being's construction in thought, and in that respect it is similar to

historical Neoplatonism's turn away from objective externality toward the inwardness of psyche. And yet, if it is a turn toward the inner it is *also* a redirection outward, an expression, a reconstruction of the universe as given as a universe adequate to spirit's way of being. It is not an ascent to a higher cosmos, a *τόπος νοητός*, but the first formation of cosmos.

More and more as Schelling moves toward the Philosophy of Freedom and *Ineinsbildung* becomes not the already-accomplished work of the Absolute standing behind and constitutive of system but the timely task of the human spirit living in history, thus an active process, does he approach endorsing a fully dualistic notion of system. The ontological polarity of Ground and Existence, the philosophical polarity of factual individuality and conceptual systematic grasp, and the temporal process of division and revelation in spirit's life which these polarities occasion all indicate a definitive turn away from Greek ways of thought on Schelling's part, an abandonment of the Neoplatonic system-problematic with its demand for unity, hierarchy, integrity as oneness and completeness as *stasis*. Indeed in following out the problem of individuality which developed in the System of Identity and in the recognition of facticity in the Philosophy of Freedom, Schelling comes close to endorsing an eternal matter<sup>54</sup>—or a permanent Non-Ego—over and against which the spiritual (God and man, together in the Creation) must progressively define itself, not only inwardly in knowledge, but outwardly in time and in history.

## NOTES

1. Werner Beierwaltes has carefully enumerated most of the pertinent affinities in *Platonismus und Idealismus* (Frankfurt a.M., 1972) pp. 100-144. More to our interest and more central to the concerns of this paper is his suggestion that these affinities grow from one central point, from a shared problematic—a concern for 'the One as the principle of philosophy, a principle discoverable only in and through spirit's work of freedom (p. 144).
2. 1804 was a year of critical Platonic and Neoplatonic influence upon Schelling. In February he thanks Windisch-

mann for his German translation of the *Timaeus*, remarking that he is tempted to read it as a late or Christian document, not a product of antiquity. *Aus Schellings Leben in Briefen*, ed. G. L. Plitt (Leipzig, 1869) vol. II, pp. 8-9. Later the same month he thanks Windischmann for the edition of Jacob Boehme he has sent. Plitt, II, p. 10. In April he requests the works of Bruno and the Ficini edition of Plotinus. Plitt, II, p. 16.

In September of 1805 he requests Windischmann to send other Plotinian texts on the nature of matter, time, space, death and finitude. Curiously enough, in the same letter he admits that the Platonic-sounding term *Abfall* whereby he had been trying to indicate the adventitious character of the finite considered in itself was only metaphorical and unsuited for conducting exact analysis. Plitt, II, pp. 72-73.

3. Beierwaltes, *op. cit.*, p. 104n.

4. There is a kind of achieved consensus in recent Schelling scholarship that the variegated sixty-year career of speculation, for all of its apparent changes, pursues one central problematic and has one metaphysical preoccupation alone, viz, the testing of systematic speculation against 'the real.' Schelling's ultimate contribution is seen to be the limitation of the notion of system, the discovery of intractable individuality and the facticity of even spirit. Cf. W. Schulz, *Die Vollendung des deutschen Idealismus in der Spätphilosophie Schellings* (Stuttgart & Cologne, 1954), J. Habermas, *Das Absolute und die Geschichte* (Bonn, 1954), Martin Heidegger's 1936 lectures *Schellings Abhandlung über das Wesen der menschlichen Freiheit* (Tübingen, 1971), and F. W. Schmidt, *Zum Begriff der Negativität bei Schelling und Hegel* (Stuttgart, 1971). For the limited purpose of this discussion we find it useful to make these relative distinctions in Schelling's development. The young Schelling's work is diverse but most original in its concern with nature, so we shall call the years 1794-1800 the 'Philosophy of Nature.' The years 1801-1806 are the System of Identity. The works of 1809 - 1815 are appropriately called the System of Freedom, and the writings of 1821-1854 the Late Philosophy or the Positive Philosophy.

13. The earliest expression of the system-idea is this:  
The absolute Identity exists in the individual under the same form in which it exists in the Whole, and conversely, it is in the Whole in no other form than in that under which it is in the individual (*Werke*, 4:132).  
The following text from the *Lectures on Academic Studies* provides the clearest and most representative statement of the whole system-notion:  
The Absolute simply for itself is necessarily pure Identity, yet the absolute form of this identity is to be in an eternal manner subject and object. . . Neither the subjective nor objective element in this eternal act of cognition is the Absolute, but that which is equally the substantial core of both, which accordingly is disturbed by no difference. The same identical essentiality is in the objective side of this absolute production a forming of ideality into reality and in the subjective side a shaping of reality into ideality. The same subject-objectivity is in both of these and [thus] the whole substantial core of the Absolute is posited in the absolute form. (*Werke*, 5:281)
14. In a letter of 25 May, 1801 Schelling apologizes to Goethe for retaining his edition of Spinoza while he works upon the expansion of his *Presentation*. *Schriften der Goethe-Gesellschaft*, Vol. 13, (Weimar, 1898), pp. 217-218.
15. Kant's mention of a systematic use of pure reason—or reason operating under a principle of thorough-going determination and providing a total field of all possible

predicates or determinations as a background for the specification of the possibility of any one particular—may have attracted Schelling's attention in this direction. Cf. *Critique of Pure Reason*, A571-73, B599-601.

16. The development of the problem of individuality and individuation in Schelling's thought can be briefly indicated here. The System of Identity basically reduces particularity to differently indexed or articulated universal structures, structures of indifference or subject-objectivity. Individuality for the system is a function of structure and each individual is able to recapitulate all others. The "Bruno" of 1802 indicates Schelling's awareness of a new problem: Individuality on systematic terms in no way accounts for phenomenal plurality "or" for the spatial, temporal and causal textures of the interconnection or disconnection of phenomenal individuals. Individuation is seen to be explicable only as a sort of self-exclusion from the organic particularity of systematic individuality ("ideas").

*Philosophy and Religion*, 1804, proposes an account of particularity reminiscent of Erigena's Christianized and historicized Neoplatonism—the "fall" of the ideas away from the Absolute (pure ideality) and their return, enriched by reality.

*Aphorisms Introductory to the Philosophy of Nature*, 1805, explains finite particularity as the perfect particularity of ideas (or systematic individuals) intuited through distorting complexes of external relations. This is the most sophisticated explanation of individuality the System of Identity offers, and the most rigorously Neoplatonic.

In the *Essay on Freedom* of 1809 Schelling gives up the attempt to think finitude as an aberration of the organic particularity congenial with system and finds himself forced to adopt a primitive ontological principle of individuation, the *Grund*. Henceforth he thematizes the confrontation of system and intractable individuality as the overriding philosophical question.

17. It is easy to locate texts which state the Identity-System in a strikingly Neoplatonic guise, i.e. as a three-levelled

hierarchy of being. Though they do indicate the influence of Plotinus after 1804, they somewhat conceal Schelling's precise systematic interest, which we maintain, is Neoplatonic and which antedates any casting of the system into a three-orders-of-being form. For example,

From eternity and in eternal ways this *unity* creates images of itself in the infinite, From this eternal in-forming of unity into infinity, however, sensible nature wrenches itself free and is the mere *appearance* thereof or the eternal inbuilding subsisting under mere relations.

Aphorisms Introductory to the Philosophy of Nature, *Werke*, 7:176.

18. Cf. *Ennead* IV.7.8<sup>5</sup>:46-9:2 and *Ennead* V.9.9:3-8. Both texts derive from Plotinus' meditation upon the *Timaeus*. Cp. also IV.8.6:18-28.

19. *Ennead* I.6.7:8-12; *Ennead* V.6.6: 20-21.

20. Proclus insists that thought must come to rest in one principle or lose itself in the infinite. It must come to a stand, fall into an order, proceed by determinate method, and accomplish its work in a finite set of operations. Cf. *Elements of Theology*, 2nd ed., tr. E. R. Dodds (Oxford, 1963), Props. 4, 11.

21. *Element of Theology*, Props. 6, 7, 11. Note the argument for Proposition 11:

... But if all things were uncaused, there would be no sequence of primary and secondary, perfecting and perfected, regulative and regulated, generative and generated, active and passive; and all things would be unknowable. For the task of science is the recognition of causes. (Dodds, *op. cit.*, p. 13.)

For the interesting suggestion that the *Grund/Existenz* dichotomy reflects the Fichtean polarity of Ego and Non-ego see M. Vetö, "Le fondement selon Schelling," *Revue Philosophique de Louvain*, 70 (Aug., 1972), pp. 393-403.
32. *Element of Theology*, Props. 15, 16, and especially 17.
33. Consult *De mundi sensibilis atque intelligibilis forma et principiis* (1770), section 10, for Kant's first definition of intellectual intuition as a divine or 'principiating knowing' or perhaps a 'cognitio symbolica.'
34. *Werke*, 4:322-23, 6:143.
35. Würzburg System of 1804, *Werke* 6:137.
36. Deduction of Dynamic Processes (1801), *Werke* 4:77-78 and Presentation of My System, 4:123.
37. This definition of indifference seems to have been relatively enduring and of final validity for Schelling. Cf. *Werke*, 5:216, 7:205, and 'Ages of the World,' *Nachlassband*, p. 50. In "Philosophy and Religion," a work influenced by Schelling's actual reading of Plotinus, Schelling dismisses all other ways of defining indifference and makes the Absolute pure identity. Cf. *Werke*, 6:24-25.
38. For the first statement of this position, see Presentation of My System, Props. 19, 21, 22, 23, *Werke*, 4:122-123.
39. On the recapitulative nature of the recurring relative totalities or 'potencies' see 4:290-291, 4:419, 4:426, and

- 5:367. On the recapitulative nature of the perfect individuals or 'ideas,' whose function in the system is the same as that of the potencies, see 5:389-390, 7:163, and 7:203.
  40. *Ennead* IV.8.6:7-11 is typical of this line of thought which receives more technical formulation elsewhere as a principle of double-power or double-functioning.
  41. *Elements of Theology*, Prop. 25.
  42. Schelling clearly mirrors the hesitation of the Neoplatonic tradition, mediated as it is to him through Spinoza, when he declares that no system can solve the problem posed by the first synthesis or derivation, the passage from the infinite to the finite. *Werke* 1:34.
- The centrality of the Neoplatonic system-problematic to the process of his thought is attested by the reappearance of the same quandary in the latest formulation of the system-question:
- It is as if the whole world lies within the nets of the understanding or of reason, but the question is precisely this: How has it come into these nets? Manifestly there is something other and something more in the world than mere reason, and what is more, something which struggles to transcend these boundaries.
- Munich Lectures on the History of Philosophy, *Werke*, 10:143-144.
43. Proclus expresses all the contradictory nuances well:  
 ... In so far, then, as it has an element of identity with the producer, the product remains in it; in so far as it differs, it proceeds from it. But being like it, it is at once identical with it in some respect and different from it: accordingly it both remains and proceeds, and the two relations are inseparable.  
*Element of Theology*, Dodds translation, Prop. 30 argument, p. 35.
  44. *Ibid.*, Prop. 28 argument.
  45. Typical of Schelling's expression of this intricate notion is this passage, heavy with Spinozistic connotations:  
 This eternal—eternal by the very concept—reflexion into one another of form and substance is the realm

of nature or the eternal birth of God in things and the equally eternal reassimilation of these things into God, in such fashion that . . . nature itself is the full divine existence, God seen in the actuality of his life and self-revelation. *Werke*, 7:59.

46. Proclus himself entertains the notion of a coordinate unity and manifold as principles of being, but finds himself forced to reject the suggestion as leading to an infinite regress in search for an actual one. *Elements of Theology*, Prop. 5, argument.

The closest that Neoplatonism actually comes to Schelling's systematizing operation of *Ineinsbildung* is suggested by Proclus' assertion of the equivalence of immanence, procession, and reversion: "Every effect remains in its cause, proceeds from it, and reverts upon it." *Elements*, Prop. 35. Note that Proclus asserts this equivalence to obtain only within the overarching relation of causality, within its implied demand for subordination.

47. Cf. *Elements*, Prop. 20. Proclus indeed mentions a replicative function of systematic ordering— "All things are in all things"—but fails to integrate this into the predominant scheme of causal ordering. *Elements*, Prop. 103.
48. *Elements*, Prop. 26.
49. *Ibid.*, Props. 78 and 79.
50. Other significant instances of the double-act explanation of hypostasis are: *Enn.* V.1.6:28-34; *Enn.* V.2.1:12-18; *Enn.* IV.8.6:7-10. In *Enn.* II.6 the double-function schema is generalized into a solution to the problem of the nature of qualities in *nous* and in the sensible.
51. Aphorisms Introductory to the Philosophy of Nature: "The spirit of true philosophy is the inbuilding and uni-forming of the general and the particular in infinite ways", *Werke*, 7:142. Cf. Further Expositions of My System, *Werke*, 4:394, 4:415.
52. Bruno, *Werke*, 4:327, Further Expositions, *Werke* 4:380.
53. Thus Schelling's insistence, throughout the System of Identity, that the appropriate method of systematic philosophy is not dialectic, which is just a dynamic form of exclusion, and thus confined within the sphere of

'Reflexion,' but an *Eins-und ineinandersetzen*. *Werke*, 4:399.

54. Cf. Essay on Human Freedom, *Werke*, 7:357-359. Compare Plotinus' definition of matter as the "darkness of the individual thing," *Ennead* II.4.5:6-8.

## The Problem of Ordered Chaos in Whitehead and Plotinus

David F. T. Rodier

*The American University*

In this paper I shall attempt to show how the study of neoplatonism might help elucidate certain problems in process philosophy. I shall do this by directing attention to Whitehead's puzzling accounts of creativity and of non-statistical judgments of probability in *Process and Reality* and show how certain difficulties in his accounts might be clarified by considering them as reflecting certain central and familiar problems in the philosophy of Plotinus. I shall begin by analyzing the problems of Whitehead's account and attempt to state what I feel are his important underlying presuppositions. I shall then turn to a discussion of "sympathy" (*sympatheia*) and matter in Plotinus' philosophy. Finally I shall attempt to show that Whitehead's category of creativity and his non-statistical probability are expressions of the same philosophic concerns as Plotinus' account of matter and *sympatheia*, and perhaps they may be only the reinterpretation of a neoplatonic theme in terms of process metaphysics.

### I

Even as sympathetic an interpreter as Donald W. Sherburne has characterized Whitehead's account of the category of creativity in *Process and Reality* as "elusive"<sup>1</sup> and "terse to the point of obscurity."<sup>2</sup> Certainly, Whitehead's formal definitions are formidably technical:

'Creativity' is the universal of universals characterizing ultimate matter of fact. It is that ultimate principle by which the many, which are the universe disjunctively, become the one actual occasion, which is the universe conjunctively.<sup>3</sup>

'Creativity' is the principle of *novelty*. An actual occasion is a novel entity diverse from any entity in the 'many' which it unifies. Thus 'creativity' introduces novelty into the content of the many, which are the universe disjunctively.<sup>4</sup>

However, Whitehead's explicit analogy between his category and Aristotle's matter helps to clarify these definitions:

'Creativity' is another rendering of the Aristotelian 'matter,' and of the modern 'neutral stuff.' But it is divested of the notion of passive receptivity, either of 'form,' or of external relations; it is the pure notion of the activity conditioned by the objective immortality of the actual world – a world which is never the same twice, though always with the stable element of divine ordering. Creativity is without a character of its own in exactly the same sense in which the Aristotelian 'matter' is without a character of its own. It is that ultimate notion of the highest generality at the base of actuality. It cannot be characterized, because all characters are more special than itself. But creativity is always found under conditions, and described as conditioned. The non-temporal act of all-inclusive unfettered valuation is at once a creature of creativity and a condition for creativity.<sup>5</sup>

From these passages two things become clear: (1) creativity is the dynamic element in Whitehead's process philosophy; (2) creativity is not to be understood as change merely in the sense of a universal flux, but as a principle of novelty. The first point, *i.e.* the dynamic nature of creativity, underscores Whitehead's overt divergence from Aristotle. This divergence is clear even in Whitehead's analogy between creativity and Aristotelian matter, since in the Aristotelian system matter is the potentiality for change while in Whiteheadian metaphysics

creativity is the necessity for change. The universe of the process philosopher not only is ever changing but it must of necessity ever be changing. For Whitehead, at least, "The elucidation of meaning involved in the phrase 'all things flow,' is one chief task of metaphysics."<sup>6</sup> Nevertheless, this change which characterizes the universe is not a mere Cratylean flux. It is an ordered, directed change: the change of a universe which is always "a creative advance into novelty."<sup>7</sup> That the flux of the universe is always in the direction of novelty is not the result of constraint placed on unsystematic and random change by some divine Demiurge. Rather in Whitehead's scheme God, who is the "creature of creativity,"<sup>8</sup> acts to direct and guide the operation of creativity by the valuation of possibilities in his primordial nature.<sup>9</sup> Nevertheless, God's activity is one of heightening the novelty of the creative advance. It does not as such bring novelty into being. In and of itself creativity is, as we have seen, always a movement towards novelty, apart from any specific divine intervention.<sup>10</sup> At this point one wonders whether Whitehead's category of creativity might not have more in common with Aristotle's matter than he noticed. Not, it is true, with matter characterized as passive but with matter characterized as "yearning for form as the female yearns for the male."<sup>11</sup> Certainly, Whitehead seems almost to say that in and of itself creativity requires not only the creation of another entity but of an entity which is novel in a non-trivial sense, *i.e.* has more than a numerical difference between itself and all other entities. Precisely this same conceptual tension between change in the sense of something different and change in the sense of something interesting occurs in Whitehead's discussion of probability and the justification of induction. And so it is to his account of "non-statistical judgments of probability" that we must turn.

## II

Whitehead's account of "non-statistical judgments of probability" occurs in section eight of part two of *Process and Reality*. In contrast to his category of creativity, his account of these non-statistical judgments has been little noticed.

Whitehead begins by summarizing the four lines of argument by which he defends induction on the basis of his metaphysical system. These are:

... (i) that each actual occasion has at the base of its own constitution the environment from which it springs; (ii) that in this function of the environment abstraction has been made from its indefinite multiplicity of forms of definiteness, so as to obtain a concordant experience of the elements retained; (iii) that any actual occasion belonging to an assigned species requires an environment adapted to that species so that the presupposition of a species involves a presupposition concerning the environment; (iv) that in every inductive judgment, and in every judgment of probability, there is a presupposition, implicit or explicit, of one, or more, species of actual occasions implicated in the situation considered, so that [by (iii)] there is a presupposition of some general type of environment.<sup>12</sup>

To understand this account we must remember that for Whitehead each actual occasion (and these actual occasions are, among other things, the ultimate thing in the physical world) creates itself. However, this self-creation is not *creatio ex nihilo*, rather each actual occasion uses as the material for its self-creation both the world as available to it and its subjective aim, which is, as it were, the directionality given by God for its self-creative process. The first two of Whitehead's propositions state the limitation which the given world imposes on the freedom of each actual occasion to make itself. Any new actual occasion can come into being only in relation to the world as it is when the actual occasion arises. However great the novelty of a new actual occasion, it arises on the basis of its past which provides the initial data for its self-constitution. Whitehead insists that he can avoid strict determinism here, however, since, although the past is always given, there always are many different ways in which the past may be apprehended (this is Whitehead's abstraction "...from its indefinite multiplicity of forms of definiteness").<sup>13</sup> But just as the necessity of an actual occasion's arising from a definite, given past means that any actual occasion must in some sense of the words reflect and

embody its past so this same necessity entails that, given an actual occasion, its past must have been of a certain kind ("any actual occasion belonging to an assigned species requires an environment adapted to that species").<sup>14</sup> Whitehead summarizes both these lines of argument in a single sentence: "Thus the basis of all probability and induction is the fact of analogy between an environment presupposed and an environment directly experience."<sup>15</sup>

Before further developing Whitehead's account, it might be well to emphasize just how radical is his break with his British Empiricist tradition. For Hume, and for many contemporary writers, matters of fact are atomic and have no relationships or infinitely many relationships. For Whitehead not only are there real internal relationships among things, but any given thing presupposes a determinate set of possible environments out of which it could have arisen. The relationship between an actual occasion and its environment is not so strong as to allow the environment completely to determine the actual occasion but neither is it so loose as to allow just anything to arise from anything. In this reasserting of the principle of "like gives rise to like," Whitehead remains closer to the classical tradition than many modern philosophers.

Whitehead continues his discussion by noting that there is another principle which is relevant to the discussion of induction. This principle is "The principle of the graduated 'intensive relevance' of eternal objects to the primary physical data of experience" which "expresses a real fact as to the preferential adaptation of selected external objects to novel occasions originating from an assigned environment."<sup>16</sup> This principle is the statement in the context of the theory of induction of Whitehead's doctrine of "subjective aim." As was stated above the absolute freedom of the self-creation of any actual entity is limited both by its past which provides it with the data from which it is to work and by its subjective aim. This subjective aim is defined, somewhat obscurely, by Whitehead as the "endowment which the subject inherits from the inevitable ordering of things conceptually realized in the nature of God."<sup>17</sup> Whitehead goes on to explain that God:

...is that actual entity from which each temporal concrescence receives that initial aim from which its self-causation starts. That aim determines the initial gradations of relevance of eternal objects for conceptual feeling; and constitutes the autonomous subject in its primary phase of feelings with its initial conceptual valuations, and with its initial physical purposes. Thus the transition of the creativity from an actual world to the correlate novel is conditioned by the relevance of God's all-embracing conceptual valuations to the particular possibilities of transmission from the actual world, and by its relevance to the various possibilities of initial subjective form available for the initial feelings.<sup>18</sup>

Since, then each actual occasion has this intuition (or in Whitehead's terminology "prehension") of "the graduated order of appetitions constituting the primordial nature of God,"<sup>19</sup> and since this vision, present as the subjective aim, is the most intense vision of what the actual occasion could become, there is the overwhelming tendency for most actual occasions to tend to fulfil this divinely given vision. But if the self-creation of every actual entity tends usually to conform to the order given in the primordial nature of God then the future will tend always to produce novelty, since, in the Whiteheadian metaphysics, "God is the organ of novelty, aiming at intensification."<sup>20</sup> Thus, Whitehead arrives at "an intuition of probability respecting the origination of some novelty."<sup>21</sup> This is "an intuition of an intrinsic suitability of some definite outcome from a presupposed situation," which "depends upon the fundamental graduation of appetitions which lies at the base of things, and which solves all indeterminations of transition."<sup>22</sup> These judgments neither are statistical in nature nor are they justified by appeal to any statistical theory of the nature of physical reality. But equally they are not religious in nature although any judgment of non-statistical probability is ultimately based upon a vision of the way the primordial nature of God is grasped by the particular actual occasions. But such non-statistical judgments "lie at a far lower level of experience than do the religious emotions,"<sup>23</sup> for "the concept of religious feeling is not an essential element in the concept of God's function in the universe."<sup>24</sup>

In Whitehead's account of creativity and of non-statistical judgments of probability we see a common, underlying theme: that of a dynamic tendency in the universe which is in some sense limited so that the dynamism of things does not become a dissolution into chaos but remains ordered. However, this ordered nature of change must never be thought of as imposed on the dynamism from without. The nature of creativity itself is directed towards novelty and the directionality of each actual occasion towards novelty of the highest intensity, although derived from the primordial nature of God, is part of the internal concrescing nature of each actual occasion. It is precisely this peculiar structure of dynamic, but self-ordered, principles of change which I think might be illuminating and illuminated by comparison with Plotinus. I am not intending to assert that there is any direct influence of Plotinus on Whitehead. Indeed Plotinus' name is never mentioned in *Process and Reality*. What I do intend to show is that the same set of problems occurs in Plotinus' philosophy and that perhaps a juxtaposition of the two philosophers' accounts may illuminate each. The Plotinian equivalent of Whitehead's creativity seems to be matter; that of non-statistical judgments of probability seems to be *sympatheia*. I shall discuss these two in reverse order.

### III

In Plotinus' philosophy *sympatheia* is not only a principle of causal explanation but also a quasi-dynamic aspect of nature. The early history of the doctrine of *sympatheia* is obscure. The idea may have derived from primitive ideas of sympathetic magic.<sup>25</sup> It is still unclear just when the idea moved from the sphere of magic to that of philosophy.<sup>26</sup> The proximate source of Plotinus, use of the term seems to be stoic.<sup>27</sup> For the Stoics the term *sympatheia* was not quite free from magical connotations since it was frequently used to explain the validity of the various types of divination commonly used.<sup>28</sup> For Plotinus also *sympatheia* is used to explain why the predictions of astrologers were occasionally correct and why charms might be effective.<sup>29</sup> In an early passage<sup>30</sup> Plotinus lists a number of effects of *sympatheia* which do not seem to be too far removed from the

realm of homeopathic magic: the growth of animals and plants is affected by their *sympatheia* with sidereal configurations;<sup>31</sup> the kinds of things which are characteristic of various countries are determined by *sympatheia*; and human differences both physical and mental are affected by *sympatheia*. However, it is not clear whether this passage gives Plotinus' own theory or is rather a polemical statement of an opponent's position. The most extensive discussion of *sympatheia* by Plotinus occurs in the group of treatises devoted to "The Aporia concerning Soul"<sup>32</sup> which seem to come from near the middle of his writing. In this discussion Plotinus implicitly distinguishes between two kinds of *sympatheia* by sharply distinguishing between states of affairs which are signs of other states of affairs (the *sympatheia* presupposed by divination) and states of affairs operative upon other states of affairs (the *sympatheia* presupposed by magic). For convenience a terminological distinction not used by Plotinus will here be introduced: the *sympatheia* presupposed by divination will be termed predictive *sympatheia* while that presupposed by magic will be called operative *sympatheia*. Predictive *sympatheia* is a universal condition which exists because the universe is an organic whole and thus each part of the universe in some way mirrors the action of every other part. Since predictive *sympatheia* is grounded in the nature of the cosmos, Plotinus discusses it in terms of the relations holding between Soul and the phenomenal world. Operative *sympatheia* on the other hand is a local rather than a universal condition. Magic is effective because one part of the universe is in a condition of *sympatheia* with certain other specified parts of the universe. Operative *sympatheia* is also discussed by Plotinus in terms of perception, which is one of the most accessible phenomena involving interaction between two limited regions of the universe. A discussion of each kind of *sympatheia* will allow us to see their common dynamic aspect.

#### Predictive *Sympatheia*

As has been said, predictive *sympatheia* exists because the universe is an organic whole. The fact that Plotinus chooses to interpret the phenomenal universe in terms of an organic model

means that causality in terms of external relations will not be a sufficient explanation of phenomenal change. Instead the ultimate explanation of the physical world will be in terms of internal relations. The distinction between internal and external relations is made by Plotinus in the following way:

For just as the directing of a single animal is either from without and from the parts or from within, from the ruling principle; so medicine starts without and goes various ways from part to part and plans each act, but nature works from within, not needing to plan. The directing of the universe... is not according to the model of medicine but of nature.<sup>33</sup>

Plotinus' position here must be distinguished from a model of reality in terms of coherence. He is not saying here that the nature of each event is determined by the total context of all the events with which it is connected, although he might wish to assert a variant of the coherence position also, as will be seen in discussing operative *sympatheia*. But such a coherence theory would still be in terms of part influencing part and so be in terms of the model of medicine, that is, in terms of external relations. Here, however, Plotinus is asserting that each part of the universe is related to each other part in terms of its own internal structure. Each thing in the Plotinian universe contains the seminal reasons of all<sup>34</sup> and so could develop in different ways. This is rather like the empiricist assertion that any state of affairs can logically follow any other. And as with the empiricist account, Plotinus' "seminal reasons" are not sufficient to account for physical objects and the general tendency of things to develop in an orderly manner. But predictive *sympatheia* implies that each thing in the physical world presupposes Soul existentially as a principle of the unity of the phenomenal world in its development. The souls of individual things in the physical world are united in their grounding in Soul.<sup>35</sup> This unity is more than a union of souls derived from the prior identification of each with a common object of knowledge. Although the unity of individual souls does not imply an identity of passions and desires, since these result from the interaction of soul and material complexes, it is the kind of unity which various parts of an organism possess by virtue of

being members of a single living being.<sup>36</sup> This unity is an ontological unity both of origin (since the souls are all derived from Soul) and of activity (since the souls are acts of Soul). United in this manner the souls will be modified by any changes in Soul and will be altered by Soul as its activity in the souls is affected by the changing conditions of physical existence. This modification of the souls affects physical objects and so inhibits the activities of the seminal reasons constituting the various objects. Since the modification of physical objects is conditioned by the total state of all souls, the alteration in any one object will be a sign of the total state of affairs in the universe. This kind of modification may then be used predictively. Predictive *sympatheia*, then, expresses the universal tendency to change and randomness. It is the activity of the non-rational aspects of physical existence upon the rational structures of the seminal reasons.

#### Operative *Sympatheia*

Although a firm opponent of Ptolemy and other hellenistic astrologers,<sup>37</sup> Plotinus admits a form of sidereal efficacy, and thus a form of operative *sympatheia*, which seems superficially quite similar.<sup>38</sup> However he insists that any sidereal influence is neither the result of the elemental nature of the stars<sup>39</sup> nor of their volitions.<sup>40</sup> Operative *sympatheia* as Plotinus develops the concept is quite different from external constraint, for the magician, "operates from no outside standground."<sup>41</sup> And, of course, operative *sympatheia* exists apart from human employment and desire.<sup>42</sup> The basic model which he uses to interpret operative *sympatheia* is that of resonance:

The prayer is answered by the mere fact that part and other part are wrought to one tone like a musical string which, plucked at one end, vibrates at the other also. Often, too, the sounding of one string awakens what might pass for a perception in another, the result of their being in harmony, and tuned to one musical scale; now, if the vibration in a lyre affects another by virtue of the sympathy existing between them, then certainly in the All—even though it is constituted in contraries—there must be one melodic system; for it contains its unisons as well,

and its entire content, even to those contraries, is a kinship.<sup>43</sup>

This passage clearly shows that operative *sympatheia* is grounded in Logos, i.e. that harmonizing effect of Soul present in the physical world, since operative *sympatheia* exists as a result of the universe's being "a single harmony."<sup>44</sup> But operative *sympatheia* is not Logos. It is a result of Logos. Since the phenomenal world forms a single system it is possible for one part to affect another. This would be impossible in a world of discontinuous atoms. However, since the phenomenal world is not only a single system but a single system resultant from a logically prior unifying structure, there exists not only physical impacts between things, mechanical causality, but there is also action at a distance between similar things which does not affect intervening objects,<sup>45</sup> *sympatheia*.

Although unlike mechanical causation in that it acts at a distance, the action of operative *sympatheia* is similar to that of mechanical causation in that it is capable of precise formulation. The seminal reason of any particular thing in the phenomenal world comprises a carefully balanced harmony of attributes. However, the action of the seminal reason is affected by the state of affairs in the universe at the moment in which it acts. If there is simultaneous with a particular thing other things having structures similar to that thing but differing from it in that certain attributes of the first are more pronounced in the others, then those attributes in the first will also tend to become predominant in it. Thus operative *sympatheia* is a modification of the activity of seminal reasons<sup>46</sup> but its action is not random since it is both the result of the underlying pattern of the cosmos and is capable of being described in terms of probabilities. Operative *sympatheia* is also properly termed *sympatheia* (although it is quite different from non-causative, predictive *sympatheia*) since operative *sympatheia*, like predictive *sympatheia*, is grounded in the organic nature of the universe.

#### IV

Plotinus' discussion of matter is, as is well-known, notorious for its supposed confusion of moral and ontological

categories. However, I feel that that charge is merely the result of a verbal confusion, and that Plotinus simply uses the term "evil" in a very odd sense, one which is divergent from the earlier Platonic tradition. Plotinian evil is a state or mode of things rather than a class of events and so it is not the same as physical evils. It is not that Plotinus denies the existence of physical evils. He recognizes their existence and even that they are in a proper sense evil. But when he speaks of evil he means the quality of existence which is prior to the evil events and in which they participate. Plotinus' theory thus is the reverse of the Christian neoplatonist, Augustine. In Augustine while there are morally evil acts the emphasis is upon the mode of existence which is the ground of moral evil, *i.e.*, sin. While physical evils become, for Augustine, almost accidents of physical things, in Plotinus moral evils are acts of the souls and do not pertain to the proper nature of Soul. But for Plotinus evil is a fundamental condition of physical things. It should also be noted that for Plotinus evil as a condition of existence contains no moral disapprobation. That a thing participates in evil does not mean that the thing in question is (morally) bad. It is the case that evil provides the occasion for morally wrong acts on the part of individuals, but evil, as such, is not, in the Plotinian system, wicked. Evil is quite clearly limited by Plotinus to the principle of instability in the physical world.<sup>47</sup> Given this definition of evil, Plotinus believes that he can demonstrate that its existence is necessary. Wickedness could only be necessary if that which gave rise to it were also morally evil, but that the Divine Triad, which is the cause of beings, is morally evil Plotinus denies. Moral evil remains, for Plotinus, a fact of experience, but for him, unlike both the middle-platonists and the gnostics, the fact of moral evil is relevant to a description of the *psychical* but not the *physical* world.

It may be questioned whether the choice of the term "evil" is a particularly fortunate one and it may be argued that this special usage is at least partially responsible for his meaning being misinterpreted as a gnostic theory of Matter.<sup>48</sup> It certainly can not be denied that the differences between the Plotinian and the gnostic theories of Matter would have been much more evident if Plotinus had used some term such as

"creativity" or "pure potentiality" instead of the term "evil" to describe Matter. However, in defense of Plotinus' usage it must be admitted that he had already extended the use of "potential" to include both the Aristotelian "potency" and the Plotinian "possibility" and any further extension of terms related to potentiality would only have increased the possibility of misinterpretation. Further, in the Platonic tradition "The Good" and "The One" were used interchangeably. When applied to The One the term "good" was understood to be used without any particular moral connotations. Therefore, Plotinus had at least a precedent for terming that which was completely contrary to The One, "evil" and for expecting his interpreters to realize that "evil" was, like "good", being used without any moral implications. Once we see that Plotinus does not confuse axiological and ontological matters and that he uses the term "evil" to mean unlimitedness or complete instability rather than moral wickedness, the metaphysical function of Plotinian Matter is seen strikingly to resemble that of Whiteheadian creativity. Since Matter is pure limitlessness, pure lack, it receives Form. Unlike Aristotelian Matter, Plotinian Matter has no inherent tendency towards Form. Rather it is complete randomness or pure indeterminancy.

"Matter becomes mistress of what is manifested through it: it corrupts and destroys the incomer, it substitutes its own opposite character and kind, not in the sense of opposing, for example, concrete cold to concrete warmth, but by setting its own formlessness against the Form of heat, shapelessness to shape, excess and defect to the duly ordered."<sup>49</sup>

As a condition of the manifestation of Form, Matter is unstable. Matter is able to assume any Form and there is no more reason for its assuming one Form than another. Therefore, the manifestation of any Form in Matter has the instability of Matter and will not possess even momentary stability. A partial exception to this universal instability exists in the heavenly bodies, but their stability is due to the fact that the fire which composes them cannot mutate into another element because of its spatial position, not to any inherent stability of Matter. Apart from the heavenly bodies there is only generic endurance

in the physical world. Matter, for Plotinus, does not individuate<sup>50</sup> but its instability is such that Forms in it are not perfect.<sup>51</sup> In this there is no actual assigning of a positive activity to Matter. The inhibition of the Forms is a negative act. It takes place not by a positive opposition of some other Form but by a simple tendency to any other Form.<sup>52</sup>

## V

By now certain obvious parallels between Whitehead's non-statistical judgments of probability and category of creativity on the one hand and Plotinus' use of *sympatheia* and category of Matter on the other will have become evident. It only remains to state, in conclusion, these similarities more sharply.

Both the Whiteheadian non-statistical judgments of probability and the Plotinian *sympatheia* were attempts to introduce a special factor into the causal analysis of physical phenomena. Both were attempts to see the occurrence of changes in the physical world as determined by more than the simple operation of past events. Both were attempts to add as it were a verticle causal dimension to the horizontal determination of the past. Although Plotinian *sympatheia* viewed as a kind of synchronic causation may seem more familiar to us than Whitehead's vision of novelty as always the more probable event, there appears to be no reason why Whitehead's account of non-statistical probabilities might not also be interpreted as a kind of synchronic causative factor. If this possibility is allowed, then although the judgments of probability would remain non-statistical, they might well be capable of being analyzed mathematically.

The analogies between Plotinian Matter and Whiteheadian creativity seem, at first glance, to be more remote than those between *sympatheia* and non-statistical judgments of probability. Yet, if my argument that Plotinus' use of the term "evil" is not primarily axiological, then more similarities emerge. Both Matter and creativity are the fundamental dynamic principles responsible for the ongoingness of the universe. Both are attempts to take randomness and chaos seriously in construct-

ing a metaphysical system. Both are attempts to give a consistent philosophic account of Plato's myth of The Receptacle. The feeling may remain that nevertheless the connotation of the two terms is radically different — that somehow creativity is a more "positive" concept than Matter. It should be remembered, however, that even for Whitehead the processes of change in the cosmos may assume the apparent evil aspect of "the remorseless working of things," and that, "...if the best be bad, then the ruthlessness of God can be personified as *Ate*, the goddess of mischief. The chaff is burnt."<sup>53</sup> I think that the real difference between Matter and creativity is not one of positive as opposed to negative connotations. It rather depends upon the relation of each term to the other basic categories of the metaphysical system. For Plotinus when all is said and done, and despite the extreme qualifications necessary to state it correctly, Matter is in some sense ontologically dependent on The One. In Whitehead, however, God and creativity are, at best, interdependent. Thus the real contrast is between two dynamic accounts of the physical world, one of which sees all things as all unified in terms of an ultimate transcendent principle; the other of which sees everything as involving at least two ultimate principles, not engaged in a gnostic battle of good and evil, but still irreducibly distinct. Perhaps the real contrast is Whitehead's Platonism versus Plotinus' neoplatonism. If this is the case, then surely the juxtaposition of the two is mutually illuminating.

## Plotinus and Sartre, An Ontological Investigation of Being-Other-Than

by John N. Deck

*University of Windsor*

This morning, then, having freed our minds from all cares and being assured of untroubled liesure in a peaceful exurban retreat, we will undertake nothing less than a meditation on otherness.

This Meditation will be philosophic rather than what is usually called historical. I am talking about otherness, and I am concerned with Plotinus and Sartre only insofar as they can furnish hints, leads, corroborations. I am not attempting to display the influence, if any, of Plotinus upon Sartre (or of Sartre upon Plotinus) or to trace their common source in Parmenides and Plato. I am not, except when and insofar as it furthers the development of the theme, comparing and/or contrasting Plotinus and Sartre.

In the course of this account of otherness we will observe that we are saying things that are strikingly similar on the one hand to the words of Plotinus in the third century and on the other to those of Sartre sixteen hundred years later. The suggestion I wish to make is that a significant, I should say *the* significant, account of otherness is bound to reproduce what we shall honour Plotinus by calling Plotinian themes, since Plotinus came first.

So I mean this to be historical in another sense. That contemporary philosophic enterprises, whether wittingly or unwittingly, find themselves in living contact with Plotinian

notions is the most proper testimony to the continuing vitality of Plotinus. The best commentary on a philosopher is to philosophize.

For reasons which will emerge soon, it is appropriate to approach otherness *via* the otherness revealed in an analysis of knowledge, mind, the knower. I am using these terms *in propria persona*; I will indicate, when opportune, certain similarities among mind, Plotinus's *Nous*, and Sartre's For-Itself.

Knowledge is knowledge *of*. It is knowledge of (about) tree, horse, table, etc. More generally it is knowledge of being. Here at once appears *otherness*. Being is other than knowledge.

At first this otherness shows itself as an externality of being to knowledge. Knowledge is being represented as one "thing", the object of knowledge as another. But this cannot stand. The object of knowledge is the *known*. The known *qua* known is related to knowledge. There is no known without a knowing. And conversely, there is no knowing without a known. The otherness can no longer be represented as thing barging against thing, but as relative opposition. And the otherness is internal to both the knower and the known. The knower needs the known; this need is internal to the knower (this need *is* the knower) and so the known is "in" the knower. The known needs the knower to be a known; this need is internal to the known and so the knower is "in" the known. So the knower and known are one, but are not *the* One. The knower-known is not only a dyad, but is through-and-through dyadic — dyadic on both sides.

Thus knowledge is what it is not, and is not what it is.<sup>1</sup> Knowledge is the object, is lost in the object, has as its content the object, is "identical" with the object — except that it is not the object, it is other than the object, it is the negation of the object.

As Sartre has it:

The first procedure of a philosophy ought to be to expel *things* from consciousness and to reestablish its true connection with the world, to know that consciousness is a positional consciousness *of* the world. All consciousness is positional in that it transcends itself in order to reach an object, and it exhausts itself in this same positioning. All

that there is of *intention* in my actual consciousness is directed toward the outside, toward the table... all knowing consciousness can be knowledge only of its object. (BN lxi)

The dialectic through which we have been passing began, apparently, with the mind's having a transcendent object — "knowledge is knowledge *of*." All too soon, the transcendent object became "the known," which emerged as strictly coordinate with "the knower." At the same time knowledge was seen as dyadic, indeed it seemed to have no other discernible "feature" than to be a dyad. But then the transcendent object could not be kept out of play. Knowledge is seen ultimately *as other than itself because it is other than the transcendent object*.

(Self-knowledge (a) depends on a transcendent object on pain of being contentless and (b) is still dyadic, still a "relative opposition" of knower and known.)

Plotinus's *Nous*, in being other than the One (the transcendent object) is other than itself: a through-and-through knower-known, a through-and-through one-many, a through-and-through dyad. (Cf. V, 6, 1; VI, 4, 11, 15-20 etc.)

Similarly Sartre's For-Itself (roughly, consciousness), in being other than the In-Itself (the transcendent object) is other than itself. It is not "self-identical" (in *his* terms: in Plotinus's language *it is not the One*.) It is "its own nothingness" (BN 28) — or in Plotinus's language, it is primitively an 'intelligible' matter; in short, it is otherness.

Is the self-othering of Mind the paradigm of otherness; And is it the source of all otherness?

To philosophize a bit: To the extent that there are things which are utterly separate from, and out-of-relation to, one-another they are not properly *other* from one another. (It is significant that they cannot be spoken of without these manifest contradictions "not other from one another"! — their lack-of-relation can be 'meant' but cannot be said.) If one looks at an ascending scale of being, it is only as things enter into causal reciprocities which are more and more intimate that otherness ceases to have a merely abstract logical nature and becomes concrete opposition. Thus the otherness of a living

thing from itself, the opposition of its present state (in the course of its development) to its essence, which otherness is the principle of its growth, is a more concrete and therefore a more intense otherness than the relatively external otherness of one living thing from another. The otherness within life (Plotinians read: soul) is a weak adumbration of the otherness within knowledge. The Other achieves its truest nature only in dynamic tension with the Same.

Plotinus's matter (matter-matter, not intelligible matter) represents the level of absolute dispersion of which we have just been speaking, just as do the out-of-relation "in-itselfs" of which Sartre sometimes speaks. For both, the otherness that deploys itself in order, in potency-act progression, in movement which is not mere dispersion, is basically the otherness of mind.

A subsidiary point: Sartre, perhaps because of a Cartesian bias, has little to say about conscious beings below man (brute animals) or about living beings below consciousness (trees). Now if one forgets about these, one can present a plausible case for the For-Itself (in plain language, man or the human mind) as the origin of all negation, and so of all otherness, of all potency, and, we might add, of all movement that can count as movement and of all life that can count as life — indeed, not only the origin of these, but even their sole locus. Whatever is not human mind can be made to seem an in-itself beyond the same and the other.

This, of course, cannot be the truth even with respect to the sub-organic, because the sub-organic is not in point of fact a region of absolute dispersion and externality. The obvious external relations in this region exist only as coordinate with internal relations. Thus Plotinus is much more sound in taking nature to extend to the earth as well and in recognizing nature as logos and life.

Still less can Sartre be considered correct when plants and animals are once taken account of. Here much more one must recognize internal self-otherness and self-othering which Plotinus represents, with suitable qualifications, as life, logos, even contemplation.

To return to the main theme: There is something fundamentally sound in Sartre's intuition. To put it in Plotinian

terms: life, logos, contemplation, attain their essential reality, their highest truth, in mind, in Nous. Nous is, in an Hegelian sense, "the truth of" what is below Nous. Nous is the real reality of what is below it.

By taking "knowledge is knowledge of" as our starting-point we were able to display the otherness from itself lying at the heart of knowledge, an otherness, it will be recalled, which does not disappear in the case of "self-knowledge." It has been seen also that the self-othering of knowledge is the highest level of othering, it is "the truth" of the other otherings.

As the highest othering, the highest level of being-involved-with-non-being, is mind causeless, independent?

The notion of the causeless must be distinguished carefully from that of the self-caused, although often this is not done. Causeless means what it says — it refers to that which has no cause, either itself or anything else. The original logical division appropriate here is not between self-caused and caused-by-another, but between *caused* and *causeless*. Self-caused and caused-by-another are species, so to speak, of *caused*. (Hume was well aware of this point.) Plato's Good is causeless, Aristotle's unmoved movents are probably meant to be causeless, although this is compromised by the *καθ' αὐτὴν* of *Metaphysics* A, 7 (often translated "self-dependent") and the ambiguity (at least) of "self-knowing knower". St. Thomas's God is causeless. Plotinus's One is causeless (according to the "incorrect" mode of speaking, however, it "makes itself": VI, 8, 13; cf. VI, 8, 7). Descartes, on the other hand, as is well known, refers to God as the *causa sui*.

Is mind causeless? As the causeless, the independent, mind would spin all reality out of itself. But this is not the case. The internal relation which is the self-othering is here the internalization of an external relation. Mind — to be mind — needs, as we have seen, an object transcending mind.

We know very well that Plotinus sees this. The Nous needs the One. The relation to the One is the basis of the Nous's self-relation — this Plotinus expresses by saying that the Nous turns to the One to become a knower (V, 2, 1). Its "intuitive reception", its "looking at" the One is the continuing condition for its dyadic knowing on its own level (VI, 7, 35). Also we

must give weight to the passages in which he refers to the One as the intelligible (e.g. V, 4, 2; V, 6, 2) – the One is the “external” “intelligible” by reference to which alone the Nous becomes intelligible to itself.

For Plotinus, then, the Nous is not causeless. It is caused by the transcendent object, the One. The One is causeless.

Sartre, too understands the need for the transcendent object. He toys with the notion of consciousness as self-cause, “the existence of consciousness comes from consciousness” (BN lxvi). But what consciousness causes is its own nothingness, in his expressive phrase it “*nihilates*” – in an active sense of ‘making nothing’ – its own nothingness. Its nothingness, however, must be the nothingness of *something*, that is, its nothingness must depend after all on the transcendent object, which he calls the *In-Itself*. So it is not, ultimately, self-cause.

Is Sartre’s transcendent object, the *In-Itself*, causeless?

When Sartre describes the *In-Itself*, his language is close to Plotinus’s “descriptions” of the One. What does *this* remind you of?

Being is uncreated. But we need not conclude that being created itself, which would suppose that it is prior to itself . . . Being is *itself*. This means that it is neither passivity nor activity. There is activity when a conscious being uses means with an end in view . . . the self-consistency of being is beyond the active as it is beyond the passive, . . . [it is] inherence in itself without the least distance. From this point of view we should not call it “immanence”, for immanence in spite of all *connection* with self is still that very slight withdrawal which can be realized – away from the self. But being is not a connection with itself. It is *itself*. It is an immanence which cannot realize itself . . . an activity which cannot act (cp. Plotinus V, 6, 6, 3-5) because it is glued to itself.

But if being is in itself, this means that it does not refer to itself as self-consciousness does . . . It is itself so completely that the perpetual reflection which constitutes the self is dissolved in an identity. That is why being is at bottom beyond the *self*, and our first formula can be only an approximation due to the requirements of lan-

guage . . . Being in itself has no *within* which is opposed to a *without* and which is analogous to a consciousness of itself.

. . . being is isolated in its being and . . . does not enter into any connection with what is not itself.<sup>2</sup> Transition, becoming . . . – all that is forbidden on principle. [It] can encompass no negation. It is full positivity. (BN lxxvii ff.)

Is this “uncreated” causeless? Sartre, I suppose, has said that it is. “Uncreated.”

But at this point Sartre labours under a twofold difficulty. One side of this appears to be merely logical and easily dealt with, the other is more profound. Ultimately, however, they can be seen to fit together.

On the “logical” side, Sartre is haunted by the phrase “*causa sui*”. He sees more-or-less that *causa sui* is “an impossibility” – either because there is something basically wrong with the notion itself or because neither of the “candidates,” the For-Itself or the In-Itself, qualifies as *causa sui* and their “merger” is impossible. (BN lxvi; lxxvii; 758-9; 762) But, paradoxically, the impossible “*causa sui*” would be the only phrase which could represent for him what we have called the independent. And thus, for all his calling the In-Itself the uncreated, he does not see it as *above* the impossible self-caused, but below it:

Being is without reason, without cause, and without necessity; the very definition of being releases to us its original contingency. (BN 758; cp. BN lxxix)

It is only by making itself for-itself that being can *aspire to be* cause of itself. (BN 758, italics mine.)

Although the use Sartre makes of the word “contingent” here is common enough, it is perhaps well to point out that he does not mean that the In-Itself is contingent on, or dependent on, anything, but rather that it is simply “not necessary,” that it is a pure happening (if that word can be purged of all connotation of activity and/or passivity), as he says, a “venture” (BN 760). The notion would be conveyed better by the Greek conception “by chance.”

Sartre has not "happened upon" the Plotinian notion of "above chance and necessity." (Cf. VI, 8, 9) Along the lines we have been developing, we could regard this as a simple logical failure. For him the necessary would be the impossible *ens causa sui*. He has available to oppose it only the "by chance." (And so the For-Itself is similarly "by chance", the "absolute event")

But other motives are in play here. One I may mention briefly; it does little credit to Sartre. Would any one have suspected from the description of the In-Itself which I just quoted that Sartre tries to make this notion do duty for individual existents? But this is the case. The "above chance and necessity" of what he *seems* to be describing cannot be let to emerge when the "In-Itself" is confused with "individual" beings which are (rather primitively) conceived as coming and going "contingently", i.e., by chance.

The *For-Itself* is not the independent either — as we have seen. But in the place of saying that it leans on the independent or strives for the independent, Sartre will say (characteristically) that it is ■ continuous and unsuccessful attempt to found itself, to be an *ens causa sui*. It is unfounded, but it tries to found itself. It tries to become a For-Itself In-Itself, but of course it cannot succeed. And yet its whole dynamism, (at least as this is portrayed at the very end of *Being and Nothingness*) is derived from its efforts to achieve in-itselfness.

And so the Nous strives towards the One, but can never be the One. It is "founded" only in and through its striving for the One.

But why does Sartre not follow this through and say similarly and without qualification that the For-Itself does not found itself, but is founded on the In-Itself? Because the For-Itself is striving not simply to be an In-Itself, but to be an In-Itself without relinquishing its for-itselfness.

Why "without relinquishing its for-itselfness"? At first glance, the answer is simple, and indeed Sartre gives it: because only as a For-Itself could it be an *ens causa sui*. The "ideal being" would be "the In-Itself founded by the For-Itself and identical with the For-Itself that founds it." (BN 762)

But if the *ens causa sui* is, as he reiterates, impossible, why does he not seek beyond it for the causeless, the independent, or rather, why when he half-discovers the causeless does it appear as a by-chance that itself "would" need the completion of self-causing? Why does "*everything take place as if the In-Itself in a project to found itself gave itself the modification of the For-Itself*"? (BN 759-760)

To be in-itself for-itself. To be in-itself without being monolithic, dead, "just there." To be the One, but the One which *knows*. What Sartre does not clearly see here, but what is really operative, is that the knowledge, consciousness, aspect of what has been called the For-Itself is struggling to get free of the for-itselfness, the duality, while retaining the advantages it had with the duality — the advantage of being conscious. "Consciousness does not surpass itself toward its annihilation: it does not want to lose itself in the In-Itself of identity." (BN 110) "It would be its own foundation not as nothingness but as being and would preserve within it the necessary *translucency* of consciousness" (ibid., italics mine).

Consciousness is consciousness *of*. Knowledge is knowledge *of*. These were the uncriticized propositions with which we began. They brought us far in our meditation upon knowledge, but they did not, after all, present the innermost nature of knowledge. There is something about knowledge which is not expressed by "the one-many", "the dialectic of the same and the different," "that which is itself and not itself", "that which is what it is not, and is not what it is" and similar expressions, no matter how adequately transformed.

Here I shall use a Plotinian term, but I must caution you at the outset that I am not using it, at least immediately or obviously, as Plotinus most significantly used it. When I say *ἐγρηγόρως*, wakefulness or awakeness, you think naturally of the place in VI, 8, 16 where he speaks of the super-knowledge of the One as an eternal awakeness. To make matters more complicated, I shall bring this doctrine into the discussion a bit further on. But as I use *awakeness* now I am thinking of a "feature," admittedly sufficiently obscure or rather philosophically obscurable, in human knowledge, in our own knowledge.

Awakeness. An indirect approach to it can be made by "sensing" the unsatisfactoriness of accounts of knowledge as dual. "To know is to become the other." Even when this is transformed to "to know is to become the known" or "to know is to become the known, not in representation but in entity and truth," we get the sense that knowledge is, strangely, being left out. "The knower is, and is not, the known." Even when the initial contradiction (for common sense) has been surmounted, when the full internality of the knower-known interrelation has been grasped, have we as yet expressed knowledge? Or have we grasped only a duality, which, however much it may be a dynamic internal tension, however much it may exceed the sensible, however much it may exceed the "material", still seems after all from a higher point of view wooden, unalive, unawake? With respect to Plotinus: Does not his ready identification of being with knowledge, of order with knowledge – at the *Nous* level – indicate that here he is not really expressing knowledge?

The term "awakeness" seems best, but it is not without its dangers. The effort must be made to catch a glimpse, in "awakeness", of something which is beyond or underlying being-awake-to (for even here the duality may creep in), and beyond or underlying awakeness as the negation of that to which it is awake.

Other possible terms are even more quickly and immediately involved in duality. Even if "consciousness" had not been spoiled for us by the iteration of "consciousness is consciousness *of*", the word "consciousness" is in itself already dual. "Awareness" summons the "*of*." "Intellectually alive" – "Intellectually alive *to*." And life, we have been saying, is through-and-through dual.

"Subjectivity" can convey a strong intimation of awakeness (I have heard it said, with becoming carelessness, that modern philosophy – Descartes – "discovered subjectivity"), but "subjectivity" can submerge itself in the *dyad* subjectivity-objectivity. Nevertheless, Descartes' *cogito* carries something of the notion. Sartre seems to approach it most closely in his notion of the "pre-reflective *cogito*."

Sartre recognizes that there is not, for every act of consciousness, a full-blown self-reflection. But neither can there

be an "unconscious consciousness". So he develops the notion consciousness (of) – with the "of" in parentheses – and says that every consciousness of an object is consciousness (of) consciousness. Consciousness (of) consciousness is the pre-reflective *cogito*, it is "what can properly be called subjectivity" (BN lxxiii).

His reasoning here is open to serious preliminary objections. There cannot be an unconscious consciousness, but this means only that there cannot be a consciousness which is not conscious of an object – not that there cannot be a consciousness which is not conscious of – or (of) itself. If consciousness is thought of after the model of a mirror, it is obvious that a mirror can mirror objects without in any way mirroring itself. Or if consciousness is thought of as an affecter or as an affected, there can, seemingly, be an affecter which does not affect itself, and an affected which is not affected by itself.

These objections can be answered by engaging once more in the dialectic of the dual, which is, at bottom, what Sartre himself does. The "of" in parentheses becomes a weakened – and for that reason a more intense – version of the "of" without the parentheses. It comes to express the original through-and-through duality of consciousness, its non-identity, its lack of coincidence with itself, its failure to be an In-Itself, its failure to be a "thing."

(I would suggest, in this restricted vein, that Sartre is reversing matters here – that the non-thingishness of human consciousness is not present from the outset, but is something to be achieved. Human consciousness emerges *eventually* as reflectively self-knowing, and from this vantage-point it can be seen that it is in germ or potency originally self-knowing. But to be in germ or in potency self-knowing is to be below self-knowing. And even Plotinus's pseudo-history of the *Nous* is better in that it speaks of phases in which the *Nous* is not yet *Nous* i.e., in Sartre's language, more like a *thing*. The pre-reflective *cogito* would, on this showing, be rather more than less thingy – it would not yet have undergone actual self-othering.)

But by this time it is plain that Sartre's critic and Sartre himself have left behind whatever hint of *awakeness* may have

been conveyed by the expressions "pre-reflective *cogito*" and "no unconscious consciousness." We are back with the dyad, and it is amusing that Sartre, who is acute enough to see the duality of reflection, indeed the duality of "knowledge" (as he distinguishes knowledge from "consciousness") and call this duality by its proper name, the dyad, does not formally recognize that he has made the pre-reflective *cogito* itself nothing else but a dyad. An unpleasant critic might say that the modern has allowed himself to drift down Greek bypaths.

Now let us explore if and how the "awakeness" which I am proposing as the innermost essence of human knowledge can be tied to Plotinus's specific use of *awakeness*.

I need not do more than remind this audience of Plotinus's thoroughgoing treatment of the duality-within-unity, the unity-within-duality of knowledge, nor how this consideration leads him in numerous places, preeminently in *Ennead* V, 6, to state that the One has no knowledge. Nor that he is not satisfied with this doctrine, so that he returns to the question in V, 4 and VI, 8 to find ways of saying that the One knows. He is plagued with dualistic expressions, he must speak "improperly", but he labours to purge the dualistic expressions of their dualism and to say:

If, now, the One's act does not become but is always, and is a kind of wakefulness which is not other than the one who is awake, being a wakefulness and an eternal super-knowledge, it will *be* in the way it is awake. The wakefulness is beyond being and Nous and intelligent life; the wakefulness is itself. (VI, 8, 16. 31-36)

Here is an eternal super-knowledge which is not dual.<sup>3</sup> According to VI, 8, 18 it is the source of the dyadic knowledge that is the Nous. There is in the One a sort of intelligence which is not the Nous. The One is the centre; from it radiate being and Nous. Being and Nous are poured forth from the One and depend on its "intellectual" nature.

A modest development of Plotinus's philosophy here would start from seeing explicitly the trace of the awakeness of the One in the knowledge of the Nous, just as the unity of the Nous is the trace of the One. Thus it would emerge that not only is there a knowledge which is above duality, above

othering and self-othering, but that even in human knowledge, which is shot through with duality, the essence of the knowledge is not the duality but rather its imitation and intimation of the knowledge which is above duality. In short, the wakefulness which is human knowledge would be displayed as an imitation of the wakefulness which is the One.

Let us go way back. We had asked whether the self-otherer could be independent and had suggested that the self-otherer needs the external other. Now we have traced intimations of our own, corroborated by notions found in Sartre and Plotinus, that the highest concrete self-otherer, the knower, is not at base a self-otherer so much as a wakefulness. A wakefulness which imitates the external wakefulness. The latter is not a For-Itself In-Itself within the limits of that vocabularily. But it is what For-Itself In-Itself was trying to express: A knowing, independent reality above chance and necessity.

## NOTES

1. This phrase is adapted from Sartre's description of the For-Itself (BN ix xviii). (Sartre's *L'Être et le Néant* (1943) is referred to in the English translation of Hazel E. Barnes, *Being and Nothingness*, New York, Washington Square Press, 1966).
2. Here, as also on BN 763, Sartre shows that he appreciates *the one-way relation*. The For-Itself is related to the In-Itself; the converse is not true. Similarly the Nous (and all things) are related on the One (VI, 9, 3, 49-51; cf. VI, 8, 7, 44-46), but the One is not related to them.
3. How tenuous this may be in Plotinus himself, however, is indicated by the fact that only a few lines before he could say "The One, as it were, made itself by an act of looking at itself. The act of looking at itself is, in a way, its to-be." The qualifications are there, but the formula greatly resembles that of the conscious self-cause that Sartre toys with and criticizes.

## Paul Elmer More and Neoplatonism

by K. W. Harrington

Emory University

### I *Introduction*

In the last decades of the nineteenth century and the first decades of the present one, the theological-idealistic orientation of American university education and philosophy gradually found itself unable to withstand the onslaughts of the rising philosophies of pragmatism and naturalism. These new movements wrought fundamental transformations in social and educational theories and practices as well as in philosophy. In education, pragmatism and naturalism succeeded by 1910 in replacing the old prescribed curriculum, with its emphasis upon the classics and mathematics, with a variety of elective courses of study which took the inclinations and abilities of the individual student into consideration and offered him the alternative of concentrating upon more "practical" studies such as the physical sciences and modern languages. Methodologically, both movements were characterized by a strong commitment to science, with science being understood as a method of inquiry rather than a definite body of knowledge. In the investigation of its subject-matter—nature, which the naturalists treated as an all-inclusive and non-defined category—science as a method excludes radical dualisms of any kind. Man's mind is not separate from nature, and his values, instead of existing in some separate realm find both their origin and their fulfillment in nature.

The multifarious influences of pragmatism and naturalism were opposed by a group of intellectuals loosely united under

the name Humanists. Two of the early Humanists, Paul Elmer More (1864-1937) and Paul Shorey (1857-1934), were also leading American Platonic scholars of the first part of the twentieth century. As professors of the classics, these scholars were distressed at the replacement of the prescribed curriculum with the elective system, as this meant that students were no longer required to take Latin and Greek. More and Shorey were among the first to challenge the assumption that attention to the present and practical is more essential to education than an emphasis on the Great Tradition of the past.

In the 1920's and 30's, the older Humanists merged with a group known as the New Humanists. This group began as a literary movement designed to combat the influence of naturalistic tendencies in the writings of such men as Dreiser, Sinclair, Anderson, Dos Passos, and Hemingway. Originally, the New Humanists were interested primarily in restoring interest in the classics and in denying the natural and spontaneous. The movement gradually broadened its interests to include those of the older Humanists, namely the opposition to all forms of naturalism and an attempt to return American college education to the old prescribed curriculum with its emphasis on the classics. The leaders of the New Humanists were Irving Babbitt of Harvard, Paul Elmer More of Princeton, and Norman Foerster of the University of Iowa.

The most fundamental belief of the New Humanists and the older Humanists was an absolute dualism between man's "lower" nature, which he shared with other animals, and his "higher" nature, which was not a part of physical nature and was characterized by will, conscience, morality, and religion. This conception of human nature the New Humanists believed to be a fundamental postulate of the philosophy of Plato and to have found additional support in early Christian and medieval thought, and, indeed, to be the central conviction of all genuinely "humanistic" thought. Other beliefs which the New Humanists thought they had derived from Plato and others in the Great Tradition were an ethic of restraint and denial of bodily pleasures; a strong social conservatism and a belief in the unchanging nature of truth, values, and human nature.

Of the leaders of the New Humanists, Paul Elmer More was especially influenced by the Platonic tradition, and indeed considered himself to be a Platonist. This paper explores certain features of More's interpretations of Plato and Plotinus. I will argue that although More considered himself to be a Platonist, he ascribed to Plato certain ethical and psychological doctrines which are in fact much closer to the philosophy of Plotinus than to that of Plato. Indeed, More considered the ethics of the two philosophers to be in essential agreement. However, More was sharply critical of some aspects of the metaphysics and mysticism of Plotinus, which he regarded as running counter to genuine Platonism. The respective sections of this paper attempt to do the following: 1) place More's treatment of the Platonic tradition in the context of the major strands in his intellectual make-up, so that one may understand his approach to Plato and Plotinus; 2) consider his treatment of that aspect of Plotinus' philosophy which he considers to differ markedly from that of Plato—viz. what More terms Plotinus' metaphysical "monism" and its attendant mysticism—and his criticism of its influence upon Christianity; and 3) finally, argue that More's fundamental belief in dualism and his desire to make Plato compatible with Christianity led him to regard the ethics of Plato and Plotinus as being quite similar to one another, whereas there are in fact important differences between the two. The significance of this for More's thought is that his own ethical beliefs are seen to be in much closer agreement with Plotinus than with Plato, so that his philosophy is in some respects more Neoplatonic than Platonic in character.

## II. *More's intellectual background*

The understanding of Paul Elmer More's interpretation of the Platonic tradition is enhanced considerably by viewing it within the framework of the major stages of his philosophical development and the predominant strands in his intellectual make-up. More abandoned an early Presbyterian religious affiliation while still in his teens, and was not to return formally to Christianity until 1925. But despite his early rejection of Christianity, he acknowledged that he was always obsessed by an awareness "of a mystery beyond the sense, out of which my

dualist philosophy was to spring, those intimations of a whole ghostly world corresponding to something latent in the soul itself,"<sup>1</sup> and he retained throughout his life a certain evangelistic fervor. In his biography of More, Arthur Hazard Dakin remarks of More's teaching at Princeton: "He did not analyze ideas for their own sake . . . In the end he saw only a right direction or a wrong direction, truth or falsehood, order or chaos, health or disease, life or death."<sup>2</sup>

An early enthusiasm for the literature of German romanticism was gradually superseded by a deep devotion to the Greek and Latin classics. Probably the single most decisive turning-point in More's intellectual life was occasioned by his discovery of an exposition of the thought of the Manicheans. In a letter to Robert Shafer, dated October 22, 1931, he describes this event and its significance as follows:

Then, in 1891, I chanced upon Baur's *Das Manichäische Religionssystem* . . . Such mental excitement as that book gave me I had never known before and have never felt since. It was as if the religious sense, like a drowning man, had laid hold of something to which it could cling . . .

This was the principle of dualism,—a crude mechanical sort of philosophy as taught by the Manicheans, but through the really magnificent allegory in which their mythology flowered hinting at a deeper and subtler truth.<sup>3</sup>

The principle of dualism first discovered in Manicheanism was to become fixed firmly in More as his single most important intellectual conviction, one which he was to retain until the end of his life and which was to appear and reappear as the most persistent theme in virtually all of his writings. Introduced to Oriental philosophy by his study of the Manicheans, More turned to the religion and philosophy of India and went to Harvard in 1892 to study Sanskrit and Pali. In 1894 he published a fictionalized account of his embracing of Eastern philosophy, *The Great Refusal*, which preaches the detachment of Hindu philosophy and the illusoriness of earthly romantic love.

There was a gradual transition in More from Hindiusm to Platonism to which it is impossible to assign a precise date. His essays "Plato" (1909) and "Definitions of Dualism" (1913)

show the increasing hold of Platonism on his thought. It is in the essay "Plato", published in the sixth series of the *Shelburne Essays*, that More outlined for the first time the conviction which he was to maintain throughout his life as the basic teaching of Plato's writings. Here he defined the "religious instinct" which he finds basic to all religions and religious philosophies, among which he includes Plato's, as:

the bare consciousness of a dual tendency in human nature . . . As the goal of this tendency we speak of an eternal changelessness, of a self-sufficient joy, and of infinite life—in the other direction lies the sense of our personality as concerned with variety and change and that world of phenomena, which is a reflection, it may be . . . of a dissipation within ourselves. In this way we come to distractions and restlessness, to self-seeking, competition, envy, jealousy, and strifes; to misery, devouring egotism, lust, and violence. Its end is despair and the irreparable decomposition of death.<sup>4</sup>

Although More shifted his attention more and more exclusively to Greek philosophy, particularly Plato, the Eastern influence was still strong enough in 1917 for him to anticipate the accusation that his Vendantic dualism had acted as a kind of Procrustean bed upon which he had forced his book *Platonism*, published in that year. An examination of *Platonism* does indeed reveal the influence of his early absorption in the world-renouncing Eastern religions with their emphasis upon the detachment of the individual from social concerns in favor of a solitary quest for spiritual fulfillment. This influence encouraged him to read into Plato's ethics and psychology certain features which are in fact much more characteristic of the fundamentally Oriental and religious philosophy of Plotinus, with its intense desire for flight from the world of physical nature, than of the philosophy of Plato with its devotion to the social life of the *polis* and its emphasis upon the inseparability of personal excellence and social cooperation.

More's own personal predilections and convictions led him to read into Plato's philosophy an extreme moral, psychological, and metaphysical dualism, and to say of the ethics of Plato and Plotinus that they are almost identical.<sup>5</sup> He also came to

regard Christianity as the fulfillment of the philosophy of Plato. The development of the Greek tradition and its culmination in Christianity is set forth in his major philosophical work, *The Greek Tradition*, a six-volume series into which he incorporated *Platonism* as the introduction. The central thesis of this work, which traces Greek thought from the death of Socrates in 399 B.C. to the Council of Chalcedon in 451 A.D., is that Greek literature, pagan and Christian, from Plato to St. John Chrysostom and beyond that to the Council of Chalcedon, is essentially a unity. "The initial impulse to the movement was given by a peculiar form of dualism developed by Plato from the teaching of his master Socrates."<sup>6</sup> Christianity was the true heir and developer of Platonism. "It is this tradition, Platonic and Christian at the center, this realization of an immaterial life, . . . that lies behind all our western philosophy and religion."<sup>7</sup> The volumes in the series are: *Platonism* (1917); *The Religion of Plato* (1921); *Hellenistic Philosophy* (1923); *The Christ of the New Testament* (1924); *Christ the Word* (1927); and *The Catholic Faith* (1931). During the writing of *The Christ of the New Testament* More became convinced of the need for a connecting link between the two worlds of permanence and change and was converted to Anglo-Catholic Christianity. The purpose of *The Christ of the New Testament* is to show that "Christ was a person who embraced within himself the full nature of divinity and the full nature of humanity."<sup>8</sup> Of the Incarnation More says that it is "the one essential dogma of Christianity, . . . that it is the mythological expression . . . of the Platonic dualism, and thus forms a proper consummation of the Greek Tradition."<sup>9</sup> His decision to reembrace Christianity resulted from the conviction that: "The Ideal philosophy of Plato waits for its verification upon no belief in anything outside of what we can test and know in our immediate experience . . . But the full scope of religion requires a theology and a mythology as well as a philosophy, and if the crowning element of religion is to be more than a reasonable conjecture, . . . then I see not whither we are to turn save to Christianity."<sup>10</sup>

The significance of this brief intellectual biography is that More's attitude toward the Platonic tradition was strongly

influenced by his fundamental belief in dualism and after his conversion to Anglo-Catholic Christianity by his religious beliefs as well. He interpreted Plato in the light of these beliefs, and approved of just those features in the philosophy of Plotinus that agreed with his sifted Platonism. His basic criticisms of Plotinus, to which I will now turn, were based upon his conviction that certain parts of Plotinus' philosophy are unacceptable to the Christian.

### III. More's criticism of Plotinian metaphysics and mysticism

We have seen that More considered the ethics of Plato and Plotinus to be in essential agreement. He did, however, distinguish sharply between the metaphysics of the two philosophers.

There are, as I see it, two modes of thought running through the *Enneads* . . . One of these is a simple but profound philosophy, expressing a genuine psychological experience and closely related to Platonism; the other is a metaphysic, of Aristotelian and Stoic stamp.<sup>11</sup>

Plotinus' most significant metaphysical departures from authentic Platonism are, according to More, his placing of the Ideas in the Divine Mind rather than granting them an independent status as did Plato, and the Plotinian conception of the One with its attendant mystical "monism" (by which More simply means that the various levels of being emanate from the Being of God), which contrasts sharply with Plato's conception of the Demiurge and his account of creation. This substitution of a metaphysical monism for the dualism of Plato More believes to be due primarily to the influence of Aristotle. Against Plato's dualism of forms and changing world Aristotle sets a dualism between an inseparable union of form and matter in individual objects, and a God Who stands in complete isolation from conscious and voluntary contact with the world.<sup>12</sup>

Hence in place of the living concrete dualism of Plato's divine energy working upon the slowly yielding potentiality of the world, we have in his successor a

metaphysical dualism which partitions the universe into two incommunicable realms: on the one side a congeries of individual things and persons, each with its own energy and potentiality and its own end, and on the other side, set in absolute goodness utterly unattainable by any individual of this world; as absolute wisdom which yet has no knowledge of or concern with the concrete sum of existences; as absolute energy exercised in contemplation, not even of itself for that would imply a distinction between knower and known, but in pure eternal contemplation of contemplation; and as an absolute cause which yet of itself effects nothing.<sup>13</sup>

More claims this Aristotelian concept of a transcendent God to have merged at an early date with Neopythagoreanism and various Oriental streams of thought, which commonly regarded themselves as being Platonic rather than Aristotelian and which culminated in the metaphysics of Plotinus.<sup>14</sup> Plotinus reduces the Aristotelian dualism to a monism, thus disavowing the isolation of the world from God, and completes their reconciliation by viewing God as the efficient cause from which the world evolves as well as the final cause towards which man's ethical nature strives.

Plotinus' metaphysical monism and its concomitant mysticism come under attack in More's chapter on "Christian Mysticism" in *The Catholic Faith*. Here More distinguishes among several kinds of mysticism: 1) The conviction of supernatural realities accompanied by a sense of the illusory nature of the phenomenal world. To this type of mysticism, which More associates with Plato, and, in the Christian tradition, with Gregory of Nazianzen, he attaches the rather clumsy appellation "mystihood". 2) An immediate contact with supernatural reality, whether given a) through sensuous sights and sounds or b) by spiritual communication. More's chief exemplar of this "quasi-mysticism" in St. Augustine. 3) Absorption of the soul in this reality, whether conceived as a pancosmic or a transcendental Absolute. Such an absolute mysticism is best represented by Plotinus. Finally, in Christianity such figures as pseudo-Dionysius and St. John of the Cross fall into a category of "mixed mysticism" which falls

between 2) and 3).<sup>15</sup> Although closely approaching the position of Plotinus, this kind of mysticism necessarily guards itself against the heresy of teaching a complete union of the soul and God.

The only kind of mysticism to which More gives his approval and which he considers to be compatible with Christianity is the first. Gregory of Nazianzen is praised for his humility in asserting that God, Who is infinite and incomprehensible to the intellect of man, can be known to mortals only as He is revealed through His works. It is impossible for man to know or to see God Himself.<sup>16</sup> Any claim beyond this More considers to be presumptuous and inimical to Christianity. Even St. Augustine, whose relatively mild descriptions of contact with the Deity hover between actual and desired vision, comes under criticism by More for laying claim "to a kind of intimacy with the divine nature which would have repelled the spiritual humility of a Gregory Nazianzen and the earlier Christians."<sup>17</sup> But it took a Greek Christian to assimilate the "full virus"<sup>18</sup> of Plotinian mysticism into Christianity. This was accomplished by the pseudo-Dionysius, "who carried the thought of Plotinus and Proclus to its logical conclusion in the *via negativa* and at the same time gave it a thin veneer of Christian respectability."<sup>19</sup> The treatises of the pseudo-Dionysius were a major influence in the wave of mysticism which invaled theology in the course of the twelfth century.

More's major objections to mysticism are clearly revealed in his discussion of St. John of the Cross, where the charges of arrogance and presumption on the part of the mystic recur.<sup>20</sup> More's second major criticism is that the extreme asceticism advocated by many mystics is incompatible with the doctrine of the Incarnation. If the flesh were as contemptible as St. John of the Cross believes it to be, then God would not have assumed the human form. The Incarnation is also rejected in that the direct contact of the soul with God eliminates the necessity of Christ as the Mediator. And as the asceticism of St. John involves not only the purgation of the pleasures and faculties of the body, but extends itself to all revelations and manifestations of supernatural things that come to the soul in sensuous form, it destroys, in effect, the sacramental use of natural things.<sup>21</sup>

More in no way impugns the integrity or the sincerity of the mystic. But he denies that the experience which the mystic has is in fact a direct contact with God. His final objections to mysticism are: "1) that an actual experience connected with a common trait of human nature is accepted naively as having a spiritual value which does not belong to it; 2) that this experience is variously interpreted in accordance with the particular religious belief of the time and place, and 3) that this arbitrary interpretation reacts to colour the naive experience."<sup>22</sup>

The actual experience which, according to More, the mystic confuses with contact or union with God can be accounted for rather easily. The mind experiences a diversity of sensations and other kinds of awarenesses. When it makes a judgment that a thing is of such and such a kind or unifies diverse experiences in some kind of way, it also exercises the ability to experience or have knowledge of unity as well as diversity. Either of these two modes of experiencing—diversifying and unifying—can be carried to extremes. An extreme awareness of diversity is a form of insanity, a condition in which there is no continuity or unity in experience. At the other extreme there is a definite and probably not uncommon experience of having all variety and diversity swallowed up in a feeling of absolute unity. And it is this feeling which More claims the mystic mistakes for union or contact with God.

More is unquestionably correct in supposing Plotinus' metaphysics and mysticism to be incompatible with genuine Platonism. Let us consider the following passage in which Plotinus describes the experience of union with the One:

Sometimes I wake from the slumber of the body to return to myself; and turning my attention from external things to what is within me, I behold the most marvelous beauty. I then fully believe that I have a superior destiny. I live the highest life and am at one with the divinity. Established there, my activity raises me above all the other intelligible beings. But if, after this rest in the divine, I descend from Intelligence to discursive reasoning, I do not understand the manner of and reason for my descent, how my soul ever could have entered into a body, being what I

have seen her to be herself, even when she still is associated with a body.<sup>24</sup>

Compare this Plotinian passage with that in Plato's *Symposium* at 209d-210a, where Diotima tells Socrates the following:

Well, now, my dear Socrates, I have no doubt that even you might be initiated into these, more elementary mysteries of Love. But I don't know whether you could apprehend the final revelation, for so far, you know, we are only at the bottom of the true scale of perfection.<sup>25</sup>

And after Diotima has ended her instruction and initiation of Socrates, we find Socrates, adding to his recollection of the fictional event which he made the core of his praise to love, the following:

This Phaedrus—this, gentlemen—was the doctrine of Diotima I was convinced, and in that conviction I try to bring others to the same creed, and to convince them that, if we are to make this gift our own, Love will help our mortal nature more than all the world. And this is why I say that every man of us should worship the god of love, and this is why I cultivate and worship all the elements of Love myself, and bid others do the same. And all my life I shall pay the power and the might of Love such homage as I can. So you may call this my eulogy of Love, Phaedrus, if you choose; if not, well, call it what you like.<sup>26</sup>

Plato's Socrates could never claim to have acquired identity with the divine. The claim would be hubristic. Plotinus attained the union with the Divine Mind and appeals to his personal experience to confirm the authenticity of the vision and the union. Socrates does nothing of the sort.

However, although More did correctly identify certain significant differences in Plato and Plotinus, he overlooked others that are equally important. In the final section of this paper I will argue that More's religious faith and fundamental belief in dualism led him to read into Plato's philosophy several positions which are in fact much more characteristic of the thought of Plotinus, and that More's conviction that the ethical doctrines of the two philosophers are quite similar is mistaken.

#### IV. *Criticism of the essential agreement More sees between Plato and Plotinus*

We have already seen that in spite of his criticisms of Plotinus' metaphysics and mysticism, More spoke with favor of what he conceived to be most essential features of Plotinus' ethics because he regarded Plotinus as espousing the same kind of ethical dualism which More ascribed to Plato. He goes so far as to say of Plotinus' account of the various stages of the soul's ethical ascent that: "It is almost pure Platonism, with however two important exceptions. Plato nowhere gives a hint of that mystical vision wherein at last the seer and the seen merge together in one indistinguishable act of objectless contemplation."<sup>27</sup> The second difference in the ethics of Plato and Plotinus More considers to be the value and importance which the latter attached to art.

A complete critical evaluation of the areas of agreement which More finds in the philosophies of Plato and Plotinus is of course far beyond the scope of this paper. I will confine myself to a brief discussion of More's treatment of the following subjects in the two philosophers: 1) the basic dualism of their ethics and psychologies; 2) physical pleasure, and sex as an illustration of it; and 3) the importance of the social life in ethics, including the nature and significance of *eros* and dialectic.

1. Dualism in ethics and psychology—In *Platonism and The Religion of Plato*, More develops the thesis that a moral dualism is at the heart of Plato's philosophy, and that upon this foundation other dualisms—psychological, metaphysical, and epistemological—arise. A particularly intimate relationship exists between Plato's moral and psychological dualisms. More goes to some lengths to establish that Plato's apparently tri-partite soul is in fact a dualism of higher and lower parts, the higher part being composed of that part of *nous* which concerns itself with knowledge of the forms, and the lower part of the soul comprising the part of *nous* which concerns itself with *doxa* as well as to *thymoeides* and to *epithymetikon*, which More translates as "concupiscence."<sup>28</sup> And so: "Philosophy then may be defined to be the [higher] soul's discovery of

itself, as an entity having a law and interests of its own apart from and above all this mixed and incomprehensible life of the body. That I take it . . . is the beginning of the Platonic religion and, if not the beginning, certainly the consummation of Christianity."<sup>29</sup> Morality involves, for More, a complete suppression of the demands of the lower part of the soul. The only command which the higher part of the soul issues to the lower part is "Thou shalt not." "Men are loath to accept this purely negative view of what is highest of their being; every instinct of the concupiscent soul cries out against this complete severance between the law of the spirit and the law of nature."<sup>30</sup>

In this respect More regards Plato and Plotinus to be in complete agreement. He even goes so far as to say of Plotinus' mood of "dismay at the subservience of the soul to its own mean and impure desires, and at the unceasing change and instability of its mundane interests" that "such a feeling . . . lies close to the origin of all philosophy."<sup>31</sup>

That such a position is to be found in Plotinus can hardly be challenged. Although Plotinus speaks of the soul both as a unity and a plurality, he also frequently refers to it in terms of a dualism of the higher part which belongs to the sphere of *Nous*, and the lower part which is directly connected with the body.

Everyone is double, one part the composite, one the Man Himself; and the whole universe is likewise double, one part being that compounded of body and a soul bound to body, and the other the Soul of the All which is not in body, but enlightens the traces of itself which is its body.<sup>32</sup>

The higher part of the soul is uncontaminated by matter and remains grounded in the intelligible world, but the lower part is contaminated by its association with matter and must be purified by means of an ethical ascent. In numerous passages Plotinus makes it quite explicit that the first stage of the ascent of the soul, which culminates in the acquisition of the civic virtues, begins with a complete renunciation of the flesh and its desires.

One certain way to this knowledge [of God] is to separate first the man from the body—yourself, that is, from your body—next, to put aside that soul which moulded the

body, and very earnestly, the system of sense with desires and impulses and every such futility, all setting definitely towards the mortal: what is left is the phase of the soul which we have declared to be an image of the Divine Intellect.<sup>33</sup>

But contrary to More's interpretation, Plato's most frequently expressed position is to see a harmony and cooperation among the three parts of the soul, with man's reasoning faculty guiding and controlling rather than suppressing and denying the other two parts. This is clear from the psychology in Book Four of the *Republic* and the myth of the charioteer in the *Phaedrus*. The charioteer is concerned to guide and control his two horses, not to beat either of them to death. And while Plato assigns physical pleasures to the bottom of his scale of goods to be sought, he seldom rejects them entirely. In the *Phaedo*, the dialogue in which Plato most clearly seems to renounce the body, it is not all clear that Socrates himself believes in the immortality of the soul or the futility of the body's concerns.<sup>34</sup> And one must not lose sight of the dramatic context of this dialogue—an old man facing imminent death can hardly be expected to be excessively preoccupied with reflections on the pleasures of the flesh.

2. *Sex as an illustration of physical pleasure*—A good case can be made for the claim that in the case of sex, which because of its complex emotional and intellectual overtones, is never merely a physical pleasure, Plato only disapproves of those relationships which are exploitive and unproductive, although Plotinus clearly regards sex as inimical to the ethical quest.

It is quite easy to distort a writer's meaning by removing his thought from the cultural climate in which he lived, particularly if he is addressing himself to ethical issues. Plato's so-called renunciation of the body and its pleasures, including sex, is a case in point. Like his criticisms of art, his criticisms of sex must not be taken out of the context in which they were written. Since Plato's fellow Athenians of the fifth and fourth centuries placed a high value upon artistic expression and were frank sensualists, Plato can afford to set very high standards for both art and sexual relationships without totally rejecting either. Good art is that which copies the forms instead of

imitations of the forms in the changing world;<sup>35</sup> a good erotic relationship is one which leads to procreation in the beautiful. The ascent of the ladder of love in the *Symposium* does not necessarily involve the rejection of physical love as one reaches the higher rungs. True philosophical *eros*, which culminates in the vision of beauty, begins with the love of bodies, and Socrates says at the conclusion of his speech: "I cultivate and worship all the elements of love myself, and bid others to do the same."<sup>36</sup> The *Phaedrus* distinguishes between exploitive sexual relationships, which are bad, and good sexual relationships, in which the two parties are concerned for the growth and development of their partners. Plato's only explicit renunciations of homosexual love are in the *Laws*,<sup>37</sup> a work of his old age which is quite difficult to reconcile with many of his other dialogues, and the *Republic*,<sup>38</sup> which seems to exclude all forms of *eros* and is probably not to be taken literally as Plato's conception of an ideal society.

More himself is rather embarrassed by the extreme sensuousness of Plato's language:

There are passages of the *Symposium*, and more particularly of the *Phaedrus*, in which the passionate colour of his language so envelops the allurements of particular objects that some effort of the mind is required to remember the ideal beauty of which they are supposed to be manifestations. The danger is heightened when he speaks with curious lack of indignation of pleasures which the world has agreed to hold unnatural and to reject the instinctive abomination. Yet in these few isolated passages where the attraction of sensuous beauty seems for the moment to have veiled the purer ethical vision, we do him a great wrong if we fail to remember that it is a passing cloud before the sun of the soul, not an eclipse. We need then to turn to the strange confession of Alcibiades at the close of the *Symposium*, and to learn again how rigidly beauty and all the seductions of pleasure were held in subjection to the refraining will. The Socrates of Plato may have portrayed himself playfully as a slave to any beautiful body and as wise only in erotic lore; when it came to the test of action he could master the lawless impulses of the

flesh unflinchingly and, as it seems, without a pang of regret.<sup>40</sup>

It is true that Plato constantly urges moderation in erotic conduct and self-control in the case of erotic relationships which would not be productive. Socrates refuses to submit to the advances of Alcibiades because Alcibiades is corrupt; although the better elements in his nature desire to possess Socrates' wisdom, his motive for wanting a physical relationship is that he wishes to make a conquest of this extraordinary man, to exercise power over him. Alcibiades admits extreme frustration over his inability to find a way to bend Socrates to his will.<sup>39</sup> For Socrates to succumb to his desire for Alcibiades would destroy any effectiveness that he might have as a teacher, and would only serve to nourish Alcibiades' vanity and conceit. But moderation and self-control are one thing; total denial is another.

3. *The importance of the social life in ethics*—One of the fundamental differences between Plato and Plotinus which More overlooks completely is Plato's strong emphasis upon the *social* nature of the quest for the good life. Plotinus constantly urges self-sufficiency; Plato denies that self-sufficiency is within the range of human possibilities. For Plotinus the ascent of the soul is a solitary affair, repeatedly spoken of as "the flight of the Alone to the Alone;"<sup>41</sup> for Plato, one reaches knowledge of the forms through *procreation* in the beautiful. Regardless of whether one is producing physical offspring or beautiful discourses, procreation inevitably involves more than one person. Although More consistently speaks of Plato's philosophy as being "otherworldly,"<sup>42</sup> the picture of life that Plato presents in the dialogues is the public life with all of its hustle and clamor, hurrying businessmen, rough jests, and noisy laughter. And the protagonist of most of Plato's philosophical dramas, Socrates, withdraws only at rare intervals from his constant involvement with his fellow men to the solitude of contemplation.

For Plotinus, the attainment of the four civic virtues, Justice, Courage, Temperance, and Wisdom, belongs to the lowest stage of the ethical ascent. These virtues do not belong to God.

But, at the beginning, we are met by the doubt whether even in this Divine-Being all the virtues find place—Moral-Balance (Sophrosyny), for example; or Fortitude where there can be nothing alluring whose lack could induce the desire of possession . . .

We cannot expect to find There what are called the Civic Virtues, the Prudence which belongs to the reasoning faculty; the Fortitude which conducts the emotional and passionate nature; the Sophrosyny which consists in a certain pact, in a concord between the passionate faculty and the reason; or Rectitude which is the due application of all the other virtues as each in turn should command or obey.<sup>43</sup>

Since the ultimate quest is to first to become God-like and finally to be united with the One, these virtues which are not possessed by the One are of limited usefulness. But there is no suggestion in Plato that there are any higher excellences that the Civic Virtues which govern the living of men together as well as the operations of the individual soul.

It is quite significant that More refers to Plato's dialectic as "the philosophy of the soul discoursing with herself, . . . and so passing ever upwards to larger and more comprehensive truth."<sup>44</sup> Although Plato does refer to dialectic as an internalized dialogue with oneself at *Sophist* 440 and *Theaetetus* 178, his many other references to it insist that dialectic is a kind of discourse of two or more persons with each other. Dialectic is spoken of as "the power of conversation,"<sup>45</sup> "the art concerning discussion,"<sup>46</sup> or "the art of asking and answering questions."<sup>47</sup> The necessity for the social nature of dialectic is closely related to Plato's view of *eros* as procreation in the beautiful. As dialectic is the only method for gaining knowledge of the forms, and as dialectic necessarily involves a conversation or discussion, Plato quite clearly means to say that the attainment of wisdom and excellence are not solitary guests. To attempt self-sufficiency is hubristic.

In conclusion, this paper has explored certain features of Paul Elmer More's interpretations of Plato and Plotinus. Although More correctly identified some of the major differences in the two philosophers, he found a fundamental

agreement between their ethics which does not in fact pertain. He was motivated in this regard by his desire to regard the philosophy of Plato as being compatible with Christianity and with the belief in dualism which More shared with the other New Humanists. Although More considered himself to be a Platonist, his ethics was in fact closer to that of the Neoplatonists than to that of Plato.

3. P. E. M. to Robert Shafer, October 22, 1931. Quoted in Francis X. Duggan, *Paul Elmer More* (Twayne Publishers, Inc., 1966), p. 20.
4. P. E. M. "Plato," *Shelburne Essays*, vol. VI (Houghton Mifflin Co., 1909), pp. 321-322.
5. P. E. M., *Hellenistic Philosophies* (Greenwood Press, 1923), p. 184.
6. P. E. M., *The Religion of Plato* (Princeton U. Press, 1921), p. vi.
7. *Ibid.*, p. vii.
8. P. E. M., *The Christ of the New Testament* (Princeton U. Press, 1924), p. 1.
9. *Ibid.*, p. 2.
10. *Ibid.*, pp. 291-292.
11. *Hellenistic Philosophies*, p. 178.
12. An assessment of the correctness of More's interpretation of Aristotle is beyond the scope of this paper. However, it seems to me that More, like many other thinkers of a religious temper, has exaggerated the importance of Aristotle's Unmoved Mover. This hypostatization of a perfect knower who acts as a final cause for creatures motivated by a desire to know does not occupy a position in Aristotle's philosophy significant enough to consider it

as the sole occupant of one side of a metaphysical dualism. Nor is the Unmoved Mover an essentially religious concept.

13. P. E. M., *The Catholic Faith*, p. 226.
14. *Hellenistic Philosophies*, p. 215.
15. *The Catholic Faith*, pp. 207-209.
16. *Ibid.*, pp. 231-232. In this connection More also regards Plato to have taught that "our knowledge of Ideas in this life is not to be immediate vision or contact, but by inference." (p. 216). This is a curious claim in the light of the *Symposium*.
17. *Ibid.*, p. 238. In this same passage More criticizes St. Augustine for surrendering to the "monistic seductions" of Plotinus by placing the Ideas in the Divine Mind. Since More apparently retained the independent existence of the Ideas, one can question whether he was in fact a Christian.
18. *Ibid.*, p. 242.
19. *Idem*.
20. More points out that there is a very fine line dividing the complete union of the soul with God in Plotinus, which is rejected by the Christian, from the kind of experience described in such passages as the following from the pen of St. John of the Cross, quoted in *The Catholic Faith*, p. 255:  

The thread of love binds so closely God and the soul, and so unites them, that it transforms them and makes them one by love; so that, though in essence different, yet in glory and appearance the soul seems God and God the soul. Such is this marvellous union. God Himself is here the suitor who . . . absorbs the soul with greater violence and efficacy than a torrent of fire a single drop of the morning dew.
21. *Ibid.*, p. 283.
22. *Ibid.*, p. 287. More fails to indicate that objections 2) and 3) would not apply to Plotinus.
23. *Ibid.*, pp. 287-290.
24. *Ennead* IV. 8. 1. Translated by J. Katz. in *The Philosophy of Plotinus, Representative Books from the Enneads*.
25. *Symposium* 209d-210a, translated by Michael Joyce, in *Plato: The Collected Dialogues*, edited by E. Hamilton and

- H. Cairns (Pantheon Books, 1966). All quotes from Plato are from this edition of the dialogues.
26. *Symposium* 212b-c.
  27. *Hellenistic Philosophies*, p. 184.
  28. P. E. M., *Platonism* (Princeton U. Press, 1917), chp. 5, "Psychology," *passim*, and *The Religion of Plato*, pp. 220-222.
  29. *The Religion of Plato*, p. 48.
  30. *Platonism*, p. 146.
  31. *Hellenistic Philosophies*, p. 179.
  32. *Ennead* II. 3. 9. See also II. 1. 5; III. 4. 3; IV. 8. 7; V. 2. 1. This and all following quotes from the *Enneads* are from the McKenna translation.
  33. *Enn.*, V. 3. 9. See also I. 1. 5; I. 2. 3; II. 3. 9. It is interesting that More occasionally remarks that Plotinus is a thorough-going ascetic (e.g., *The Religion of Plato*, p. 266; p. 228) but that Plato is not (*The Catholic Faith*, p. 221; *Platonism*, p. 82). One wonders in what sense More regarded Plato's asceticism to be mitigated, since he is supposed to have advocated "a complete severance between the law of the spirit and the law of nature." (*Platonism*, p. 146).
  34. "It is not sufficiently recognized that Plato does not, in the strict sense of the word, 'teach' anything at all about the fate of the human soul. Socrates speaks about it in myths, which are part of the dramatic structure in Plato's works. Plato's references to the authority of the priests and theologians of the mystery religions are undoubtedly an indication of the origin of these mythological symbols, but are in no way an indication of what they meant to Plato himself. For him they contained a profound symbolic reality; they were venerable allegories, images, and phrases for something that he preferred not to express in his own language. It is a mistake to use them as evidence for a Platonic theory or history of the soul." Paul Friedlander, *Plato* (Pantheon Books, 1958), vol. I, p. 29.
  35. *Republic* 500e.
  36. *Symposium* 212b. The famous passage at 211d at which Socrates says that one who has attained the vision of

Beauty will "never be seduced again by the charm of gold, of dress, of comely boys . . ." can easily be interpreted to mean that once one has reached the ultimate goal of *eros*, mere beauty and superficial display will no longer be enough to hold one.

## Contributors

A. Hilary Armstrong M.A. (Cantab.) F.B.A. is currently Professor of Classics and Philosophy at Dalhousie University in Halifax, Nova Scotia, Canada. He has served as a contributor to numerous journals, collections of papers and proceedings of conferences on Neoplatonism and on early Christian thought, including articles on Neoplatonism in the *Encyclopedia Britannica* and in the *Dictionary of Ideas*. His books include: *The Architecture of the Intelligible Universe in the Philosophy of Plotinus*, *An Introduction to Ancient Philosophy*, *Plotinus*, *Plotinus Enneads I-III*, in Loeb Classical Library, and *The Cambridge History of Later Greek and Early Mediaeval Philosophy* (general editor and author of Part III).

John P. Anton is Fuller E. Callaway Professor of Philosophy at Emory University. He is co-editor of *Diotima* and author of *Aristotle's Theory of Contrariety*, *Naturalism and Historical Understanding*, *Philosophical Essays*; and has published numerous articles on classical, Hellenistic philosophy, and modern and contemporary themes. He is presently completing a book on the Alexandrian poet C. P. Cavfy.

J. P. Atherton is Associate Professor of Classics in Dalhousie University in Halifax, Nova Scotia.

H. J. Blumenthal is Lecturer in Greek at the University of Liverpool. His publications on Neoplatonism include: *Plotinus' Psychology* and various articles. He was a participant in the 1969 Paris and 1970 Rome Congresses on Neoplatonism.

Mary T. Clark is Chairman of the Department of Philosophy of Manhattanville College in Purchase, New York. She is the author of *Augustine, Philosopher of Freedom*, *Augustinian*

*Personalism, An Aquinas Reader and Problem of Freedom* and the translator of Marius Victorinus' *Theological Treatises*. Her articles include studies of the thought of Marius Victorinus. She is currently president of the American Catholic Philosophical Association.

*J. N. Deck* is Professor of Philosophy in the University of Windsor. His writings include *Nature, Contemplation and the One* and various articles on St. Thomas.

*J. M. Dillon* is Associate Professor of Classics in the University of California at Berkeley. His primary field of interest is the history of Platonism, particularly Neoplatonism. His publications include *Iamblichus Chalcidensis In Platonis Dialogos Commentariorum Fragmenta* (1973) and *The Middle Platonists* (1976).

*Michael Dunn* is an Instructor in the Department of Classics of the University of Texas.

*John Fielder* is Assistant Professor of Philosophy in Villanova University in Villanova, Pennsylvania. His doctoral dissertation was on *The Concepts of Matter and Emanation in the Philosophy of Plotinus*.

*J. N. Findlay* is presently University Professor in Boston University. Included among his publications are *Hegel: A Re-Examination, The Discipline of the Cave, The Transcendence of the Cave, Ascent to the Absolute* and *Plato: An Interpretation of the Written and Unwritten Doctrines*, and more than forty articles.

*R. Baine Harris* is Professor of Philosophy and Chairman of the Department of Philosophy at Old Dominion University in Norfolk, Virginia. Included among his writings are *Authority: A Philosophical Analysis* (ed.) and a dissertation on the Neoplatonism of Dean Inge. He is presently serving as Executive-Director of the International Society for Neoplatonic Studies.

*K. W. Harrington* is Assistant Professor of Philosophy at Emory University. Her writings include articles on "John Dewy's Ethics and the Classical Conception of Man," and "Irving Babbitt and Hellenism," in *Diotima*. She is currently writing a book on Plotinus.

*Plato Mamo* is Associate Professor of Philosophy in the University of Calgary, Calgary, Canada. His writings include various articles on Neoplatonism.

*Evangelos Moutsopoulos* is Professor of Philosophy and Rector of the University of Athens, Greece. He is the author of twenty volumes including: *La musique dans l'oeuvre de Platon, The Critique of Platonism by Bergson, An Introduction to an Axiology of Aesthetical Object*, and *Philosophical Apprehensions* and over two-hundred articles.

*J. M. Rist* is Professor of Classics the University of Toronto. His publications include: *Eros and Psyche; Plotinus: The Road to Reality; Stoic Philosophy; Epicurus: An Introduction*; and some forty articles, mostly on Ancient Philosophy.

*David F. T. Rodier* is Associate Professor of Philosophy at American University in Washington, D.C. Among his writings are a dissertation on Plotinus and articles on Whitehead.

*R. T. Wallis* is Associate Professor of Classics at the University of Oklahoma. His publications include a book, *Neoplatonism*, and other articles on Neoplatonism.

*Michael Vater* is Assistant Professor of Philosophy at Marquette University. His writings include a dissertation on Schelling and Neoplatonism.

*John Whittaker* is Professor of Classics and Head of the Department of Classics at Memorial University of Newfoundland. His writings include numerous articles on the Middle Platonic and Neoplatonic tradition. He is currently preparing a critical edition of the Greek text of the Middle Platonic *Didaskalikos* of Alcinoos (Albinus).

## ACKNOWLEDGMENTS

Appreciation for assistance in reading and preparing this manuscript is expressed to J. Winifred Alston of Brock University, John P. Anton of Emory University, Henry J. Blumenthal of the University of Liverpool and David F. T. Rodier of The American University. The editor also expresses thanks to VaLeta and David Rodier for preparing the Index of Proper Names.
